Madison Harris

I am a young graduate student studying energy policy. While I recognize the potential benefits of AI, I also acknowledge the numerous downsides of such a fast growing, new technology, especially if completely unregulated. AI data centers add a significant burden to our energy grid, which leads to increased greenhouse gas emissions and pollution in our communities. In order to harness the power of AI, while protecting people and the planet, the AI industry must be required to transition to renewable sources of energy. For the AI industry to do more good than harm, it must be used strategically to address the world's most pressing challenges in health, climate, and technology rather than used for frivolous purposes for the sake of profit or convenience. Government intervention is essential to ensure that AI is used for the benefit of people and the planet. Without proper regulation, the AI industry will surely continue to pollute, degrade, and exploit natural resources to no end.
