Mark Clarke

As a society, we should encourage new and emerging technological advancements and innovations like artificial intelligence (AI) because of the inherent benefits associated with their development. This is partly because the innovative efforts behind the creation of these new and progressive technologies contribute significantly to the measurable progress of humanity. Nevertheless, new technology, if left unfettered, without guidelines and oversights, can result in immeasurable harm to society, particularly marginalized, vulnerable, and disenfranchised groups. Organizations such as the Department of Defense (DoD), with both influence and resources, that have employed the use of AI should do so by adopting ethical standards that are rooted in moral values, the rule of law, and industry best practices. As AI technology continues to develop, the DoD will likely maintain and sustain its position as a global leader and international partner by advancing this ethical AI strategy. Mark A. Clarke, CISM, CNDA, CE|H, Cybersecurity Law & Policy (MSL), Cybersecurity Policy (MSc CyS), and final-year Artificial Intelligence (AI) doctoral student [at Capitol Technology University]
