Greetings,

I'd like to comment on the Development of Generative Artificial Intelligence and it's consequences for us, the American people.

Copyright, is the backbone of any industry dedicated to the creation business. Copyright gives to the right holders access to a market and value to their products. Today's Generative Artificial Intelligence is only possible due to the ingestion of copyrighted material, admitted by the biggest players in the field. However, said ingestion greatly devalues the property of the right holders by competing in the same markets.

Generative Artificial Intelligence was built on the promise of great prosperity for all. Unfortunately, in the past 3 years, it has little to show for, and is unable to produce any evidence of future wealth for the working class. Instead, the lack of proper ethics, guard rails, and regulation have created an environment where crimes such as: scam, identity theft, child pornography, and many more can flourish and grow stronger.

It has been proven that the constant reliance of these systems weakens the cognitive functions of the brain, along with the fact that it produces mistakes due to a general misunderstanding of the human mind, and the lack of actual intelligence. Therefore, the usage of these tools should be highly regulated or completely forbidden for underage people, specially while developing critical thinking skills.

It has recently been said that unless we forfeit our copyrights and our rights to privacy, we will fall behind in the AI race as an attempt to deceive the American people. Stripping the public from it's rights only opens the door for revolutions. It is unwise to focus on leading a race put together by a few tech companies that's never ending and can't be possibly win, while forgetting working on actual progress that will benefit the public.

On the matter of a never ending race. We must recognize that every advancement we make can be replicated within months by our competitors, matching our performance or outright surpassing it. Giving us little to no edge while spending countless resources more.

Finally, the financial and natural resources required for the training and maintenance of these systems can't be justified based on an empty promise and the current lack of results. We shouldn't compromise entire industries based on copyrights for wishful thinking of an utopia where no one has to work.

Thank you for the opportunity to comment on this issue,

Mark Roland
