Subject: Input on the Development of an AI Action Plan

Dear Mr. D'Souza,

I am writing to provide my input on the development of the Artificial Intelligence (AI) Action Plan as part of the Request for Information (RFI) issued by the National Science Foundation, on behalf of the Office of Science and Technology Policy (OSTP). This request is made in accordance with **President Trump's Executive Order on Artificial Intelligence**, issued on February 25, 2025, which directs the development of an AI Action Plan to sustain and enhance America's global leadership in AI technology innovation.

As a researcher specializing in the use of AI in healthcare, particularly in the prediction of chronic diseases and the application of multi-omics data, I would like to offer the following suggestions to help shape the future of AI policy in the United States:

1. Integration of Multi-Omics Data for Risk Prediction in Chronic Diseases

I propose that the AI Action Plan includes policies that support the use of **multi-omics approaches** (genomics, transcriptomics, proteomics, etc.) to improve the prediction and prevention of chronic diseases. By integrating these data types, we can develop more accurate and personalized predictive models, which will benefit both public health and biomedical research.

2. AI for Early Diagnosis and Personalized Treatment in Chronic Diseases

I recommend that the plan prioritizes the application of **artificial intelligence (AI)** in the early diagnosis and personalized treatment of chronic diseases. The development and implementation of AI-based predictive models can significantly enhance diagnostic accuracy, leading to more effective treatment strategies, which in turn will reduce mortality and improve patients' quality of life. Additionally, AI's role in **precision medicine** can optimize treatment plans tailored to individual patients based on their unique health data.

3. Ethical AI Governance and Access to Open Health Data

Finally, I suggest the inclusion of clear **guidelines on ethical AI governance** in healthcare, particularly related to data privacy and security. It is crucial to create

regulatory frameworks that ensure the ethical use of open health data while protecting patient privacy. This will foster trust in AI applications in healthcare and enhance collaboration across the public and private sectors.

I believe that these proposals will not only advance the use of AI in healthcare but also contribute to a robust and responsible AI ecosystem in the United States. Thank you for the opportunity to provide feedback. I look forward to seeing how these ideas are incorporated into the final AI Action Plan.

Sincerely,

Martha Isabel González-Ramírez, Bio. Eng., M.S.
