

Response to the US's AI Action Plan

AI in its current form only exists to screw over people, and/or to generate worthless content while making absurd money for their creators for no good reason. Everything AI stands for today is pointing towards a path that leads to the death of human creativity and interactions. Generating images, text, automatic responses, chat, all of it will slowly result in our species being more and more isolated from each other. Why would I read my emails when my AI can do it, and then reply to them automatically? Which would then be read and replied by the other person's AI, making this entire process completely pointless.

Why would I hire a skilled professional to create an image when I can generate one for free with AI? It will look awful but unfortunately most people don't care, and they'd rather take an awful result if it's free. I'm seeing this in TV commercial and news already where if they don't have a proper cover image for something they just generate some trash with AI knowing full well most people wouldn't care.

And what I'm afraid the most is when AI is used to generate fake content of real-life subjects as it's trying to make it look real. We're very close to having such fake imagery and text that could easily fool lots of people into thinking a huge real-life event has occurred, when in fact it was faked for mass panic or as a call to action. There was a very good article I read a while ago which I sadly don't remember where it's from, but I do remember this part clearly: "AI takeover wouldn't be like in the Terminator series with weapons and war. All it would need to do if it was sentient and had the same intentions is to spread a huge amount of fake news to confuse people and turn them against each other for total chaos."

Now obviously this is slightly far-fetched from reality as it takes a sci-fi movie's plot into the example, but the logic is still there. When everyone has access to AI that can generate almost anything it becomes an astronomical problem because we'll soon be unable to differentiate real info from fake ones. It's already difficult to do knowing how many people generate their content with soulless AI, and it will become even worse over time.

Another point I want to address is how AI companies market their solution as a huge opportunity to uplift your business and what not. While in reality what do these AI tools do again? The answer is nothing. All we see is the marketing but there's no substance or product behind it, it's just a moneymaking scam essentially. There's literally no faithful application of today's AIs, they only exist to cause problems. I see these marketing pitches all the time saying how their AI is so good at doing X, how it's going to save them Y time on these tasks while also being cheap. While in reality it can't do anything productive at all and we can all tell the people doing the marketing also don't understand how any of this works, they just want money. Sounds familiar? That's a basic description of typical scams, just in the clothes of "AI" because it's trendy and everyone else is doing it so it's somehow justified, but we all know it's worthless trash.

All of these slowly compound together into a problem that affects pretty much everyone on our planet. When most information is fake, most responses are fake, most images and motion picture is fake, who's going to believe anything anywhere? Who's going to interact with other people when they could use their AI to do it? Some people see AI as our savior and the way to the future but they really don't realize how insanely harmful and dangerous this is. When we rely on AI to do everything for us, we'll stop existing as a species as we will no longer do anything in this world. We'll become useless and our life will simply be a

misery of not doing anything and/or relying software to do all the work for us. The end result is a huge imbalance in our perception that potentially removes some or all negatives, and leave some positives behind. Which may sound good in theory but in return will make everything miserable for ourselves. If there's no balance between good and bad in our life and events, everything will be a soulless mix of pointless experiences because the relative to compare them by will have been partially or completely eliminated.

We're arguably already in one of the biggest misinformation periods of all time in our species' lifetime and it's not getting any better as time goes on. Just look at the average person in today's world: they believe everything they're told, don't question anything and can't even think logically at all. While they're also able to mass spread whatever fake information they believe to be true to other people which are likely to believe it all. Give it enough time and we'll be sitting here drowning in mass generated fake content not being able to differentiate between what's true and what isn't.

Another huge issue is the environment. There are so many people who do their best to save our planet as much as they can, and then AI companies come in to use absurd amount of electrical energy to produce all of this worthless garbage that doesn't benefit anyone but themselves. It's mind-blowing how this is still legal after years, they're doing an unimaginable damage to our planet without being useful in the slightest.

AI in its current form simply doesn't have a use case and I strongly advise for its outright ban. I don't believe it can be productively useful for anyone other than to cause harm and misinformation. It's a huge hit on everyone in modern countries, the sole exceptions being their creators who get rich from this useless misery that hurts everyone else in return, let alone being a benefit.
