Dear Faisal D'Souza and the OSTP/NITRD NCO Team,

I am writing in response to the Request for Information on the Development of an Artificial Intelligence (AI) Action Plan. I strongly recommend that, as one of the first priority projects under this initiative, the government launch a comprehensive security white hat hacking Manhattan Project. This initiative would leverage frontier AI models—those cutting-edge systems that, while pushing the boundaries of innovation, also pose significant hacking risks.

Proposal Overview

Given the accelerating pace at which adversaries are advancing their AI capabilities, it is imperative that we adopt a proactive approach. The proposed project would bring together elite cybersecurity experts, white hat hackers, and AI researchers in a large-scale, government-led effort to:

Identify Vulnerabilities Early: Use state-of-the-art frontier models to systematically scan our critical systems, uncovering potential exploits before adversaries have the opportunity to exploit them.

Develop Robust Defense Mechanisms: Establish a dedicated framework for continuous penetration testing, red teaming, and adversarial simulations that evolves in step with rapid technological advancements.

Foster Public-Private Collaboration: Engage industry leaders, academic researchers, and government agencies to create a unified and dynamic defense strategy that not only secures our digital infrastructure but also reinforces America's leadership in AI innovation.

Set National Security Precedents: By prioritizing this initiative, the United States can solidify its commitment to national security and technological superiority, ensuring that vulnerabilities are addressed proactively rather than reactively.

Rationale

Frontier AI models represent both a remarkable opportunity for innovation and a potential security risk if not managed properly. In an era where cyber threats can emerge from any sector, this white hat hacking project would serve as a critical safeguard—ensuring that our systems are fortified against the very vulnerabilities that adversaries might seek to exploit using similar or more advanced technologies. In short, this proactive measure is essential for maintaining a secure and resilient technological infrastructure while preserving our competitive edge in AI.

I urge the Office of Science and Technology Policy and the NITRD National Coordination Office to consider this proposal as a cornerstone of the AI Action Plan. Prioritizing security

through such an initiative will help ensure that we find and address all exploits in our systems well before adversaries have the opportunity to do so.

Thank you for considering this submission.

Sincerely,

Matthew Kruse
