Mike F.

One barrier to American leadership in AI that I foresee is a population that has no idea how it works but still believes everything it says. This plan should include an education aspect. If not directly funded with federal dollars, the administration should do as much as possible to incentivize states to educate our children on how AI works. Bring in experts. Develop a curriculum that breaks things like large language models and neural networks down to terms simple enough for first-graders to understand. This needs to be learned well before college and maybe even before high school. High schools used to have auto-shop as a class. Kids would graduate knowing the basics of how their car works and how to maintain it. Back then, a car was a dangerous thing in the hands of a high-school kid until they knew how to use it. AI needs to be treated in a similar manner. I'd say it's an even more dangerous thing to a 13 year old with an iPhone unless they understand how the information they receive from AI is being generated. It's one important aspect to build out infrastructure and concentrated industry expertise now, but if a generation of American kids grow into that infrastructure and aren't educated on at least the basics then it won't be "American Leadership" in AI... it will be "A few American corporations and their cronies" leading AI.
