I believe in order for the US to remain at the forefront of development of high quality models, both large language or otherwise, there will eventually need to be a way for the model to autonomously tag its own data, in addition to the removal of any AI generated data from its dataset. These are both essential to ensure the AI does not poison itself on low quality data, which will result in a decline in quality. Acquiring high quality data will be essential to pioneering this new field. Advertising isn't a field I am familiar with, but using audio data from cookies and transcribing it, as well as any user data from apple and google(both collect and log every user's conversations with their personal assistants) could potentially see improvements in the quality of generations.
