Re: AI Action Plan

Dear Director Dohne,

We are writing on behalf of the Mount Sinai Health System to commend the Administration's AI Action Plan and offer recommendations rooted in our clinical and research leadership. Our suggestions underscore the urgent need for robust, risk-based AI governance in healthcare, aligning closely with our institutional mission and the broader goals of your initiative.

The Mount Sinai Health System, including the Icahn School of Medicine, represents a vibrant academic and clinical institution recognized for integrating artificial intelligence (AI) into healthcare. Recently named among the world's best smart hospitals by Newsweek, Mount Sinai embraces AI to enhance diagnostic accuracy, accelerate therapeutic discoveries, and personalize patient care. Evidence supports AI's transformative potential to improve healthcare delivery, clinical outcomes, and operational efficiency, affirming our institutional pursuit of AI innovation and implementation¹.

We highlight the following key priorities for the Administration's AI Action Plan, emphasizing healthcare applications:

1. Standardized AI Performance Benchmarks

With the rapid proliferation of AI tools, it is imperative to adopt uniform performance standards for evaluating accuracy, robustness, and reliability. Such benchmarks will facilitate objective assessment and

comparison across AI systems, building trust and promoting scalable deployment.

Rationale. Studies highlight standardized validation protocols as critical for ensuring AI system effectiveness and patient safety in clinical practice².

2. Continuous Real-World Monitoring

Effective governance requires ongoing oversight beyond initial validation. We urge dedicated funding and mechanisms for continuous monitoring to swiftly identify biases, errors, or unintended consequences in AI systems deployed in clinical environments.

Rationale. Continuous post-market surveillance has been shown essential to maintain AI system integrity, detect performance deterioration, and minimize bias³.

3. Transparent Reporting & Risk-Based Frameworks

Clear reporting of limitations and failure rates, tailored to the risk level of clinical or administrative applications, will ensure transparency, accountability, and informed deployment of AI technologies.

Rationale. Transparent disclosures enhance clinical understanding of AI limitations, ensuring appropriate reliance and usage, and preventing potential patient harm from AI-driven errors⁴.

4. AI Assurance and Data Governance

We strongly support mandatory fairness audits, ethical data-sharing guidelines, and strengthened patient privacy measures. Additionally, explicit accountability for AI vendors regarding adherence to data privacy standards and liability for breaches is essential.

Rationale. Rigorous data governance, including stringent privacy protection, ensures public trust and successful AI integration. Clear delineation of vendor accountability reduces institutional risk exposure⁵.

5. Investment in Workforce Training

Investment in specialized training programs for healthcare providers, regulators, and IT personnel is necessary for effectively managing AI implementation. AI should augment clinical decision-making, not replace clinicians.

Rationale. Workforce preparedness significantly influences AI adoption success, helping clinicians integrate AI as a supportive tool, not a replacement⁶.

6. Open-Source Availability of Federally Funded AI Models

The Administration should adopt policies ensuring federally funded AI models are made available as open-source resources. This measure would democratize AI access, allowing resource-constrained healthcare institutions to accelerate adoption and benefit equally from technological advancements.

Rationale. Open-source AI models have been shown to reduce barriers to entry, accelerate innovation, and improve healthcare outcomes, particularly among resource-limited institutions⁷.

7. Streamlined FDA Regulatory Processes

We urge the Administration to streamline FDA regulatory processes, providing mechanisms for expedited review of iterative AI innovations while maintaining necessary safety oversight. Simplifying these processes would facilitate more rapid integration of valuable AI tools into clinical care.

Rationale. Research has demonstrated that lengthy regulatory approval timelines may slow AI-driven innovation in healthcare. Expedited review processes can balance the need for rapid innovation with patient safety⁸.

8. Prohibition of AI Misuse by Insurers in Claims Review

We advocate regulations explicitly prohibiting insurers and benefit plans from misusing AI technologies in claims adjudication processes. Denials of medical care should not be automated; each denial decision must involve careful medical review by qualified physicians.

Rationale. Legislative investigations have identified significant risks associated with AI-driven denials of necessary healthcare services, emphasizing the ethical imperative of maintaining clinician-led oversight of healthcare decisions⁹.

The insights from Mount Sinai Health System's leadership confirm that these measures are not only timely but crucial for advancing safe and equitable AI innovation in healthcare. By integrating these recommendations into the AI Action Plan, we can build a framework

that not only accelerates technological progress but also ensures that such advancements are realized in a safe, effective and ethical way. We appreciate the Administration's proactive approach in inviting public comment and remain optimistic that, with collaborative efforts and targeted investments, we can foster a healthcare ecosystem where AI serves as a transformative force for patient care, public health, and overall societal well-being.

Thank you for this opportunity to contribute.

Sincerely,

Girish N Nadkarni
Chief AI Officer
System Chair, The Windreich Department of Artificial Intelligence and Human Health
Director, The Hasso Plattner Institute for Digital Health at Mount Sinai
