The NobleReach Foundation supports the objectives of the AI Action Plan. We believe a successful AI Action Plan must prioritize engaging America's top AI talent – to include sourcing this expertise at scale for temporary terms of service in the U.S. federal government. America is in a technological competition for the future of our national security and economic competitiveness. To win, we must not only prioritize developing and advancing AI technologies and policies but also nurturing and growing the talent behind that tech. The technical talent gap between government and industry threatens to hamper not only AI efforts in the government but also the private sector. Federal agencies tasked with developing and enforcing AI regulations, standards, and use cases need personnel who understand both the technical complexities of AI systems and the unique context of government service. Having a functional understanding of public and private sector norms, processes, and cultures will enable acceleration of AI programs across the Nation. Programs like NobleReach Scholars inspire the next generation to consider public service as part of their career journey and demonstrate an effective model for addressing this challenge. Through strategic placement of technical AI talent for short-term appointments in U.S. federal government agencies, NobleReach bridges critical skills gaps in AI, cybersecurity, and other emerging technologies. This program creates essential pathways for knowledge transfer between government, industry, and academia that builds trusted relationships necessary for meaningful public-private collaboration. We recommend that the Trump Administration's AI Action Plan build talent infrastructure at scale that address five critical areas: (1) Private-Public Sector Permeability. Establish specialized pathways that allow AI experts to seamlessly rotate in and out of the federal government through temporary assignments, ensuring alignment with evolving governmental priorities and needs. (2) Empower Intermediaries. Allow agencies to seek partnerships with intermediary organizations to carry out activities to support the development of pools of qualified individuals with the Artificial Intelligence skills and expertise necessary to meet critical personnel needs of the Federal Government. (3) Incentive Structures. Develop incentives that promote cross-sector mobility, facilitating seamless transitions between industry, academia, and government to foster collaboration and knowledge-sharing. (4) Early and Mid-Career Talent. Design a program that provides resources and education to enable early and mid-career talent in the private sector seeking to join the government in AI-focused roles. (5) Government Workforce Upskilling. Invest in comprehensive training for current government employees on AI capabilities and use-cases to enhance their ability to

effectively leverage AI in government service. The technical workforce gap in government around AI is not merely an operational challenge – it represents a strategic vulnerability. Our adversaries have fused together their civil society and military allowing for rapid cross sector innovation and technology sharing. Without sufficient in-house expertise, the U.S. government cannot effectively fulfill its critical mission to protect our citizens. Furthermore, by creating pathways for AI talent to enter the federal government on a temporary, short-term basis, we also can promote innovation and ensure America's long-term global competitiveness. By prioritizing AI talent adoption, research, and education, the Trump Administration's AI Action Plan will create the foundation necessary for rapid AI advancement and the enduring success of our country.
