Re: Request for Information on the Development of an Artificial Intelligence (AI) Action Plan

Dear Mr. D'Souza:

PwC appreciates the opportunity to respond to the Request for Information on policies and approaches for developing a national Artificial Intelligence (AI) action plan. Our views are informed by our work with a diverse spectrum of industry stakeholders to enhance business value and drive economic growth, having recognized early the transformative power of AI for both our clients and us. We believe the insights gained from this vantage can help inform a national AI strategy, which will in turn accelerate innovation and bolster economic prosperity.

Overview

AI is redefining industries and fueling economic growth. Its influence extends across sectors and functions — from modernizing supply chains, manufacturing, and healthcare to transforming business processes through automation. The ability to fully realize this transformative potential requires confidence that AI solutions will deliver operational, financial, and societal benefits as technology continues to advance. We believe there are three pillars that are critical to achieving this objective:

1. Harmonizing expectations and requirements for efficient compliance

Complex, duplicative, or overlapping regulations can slow innovation and AI adoption by introducing uncertainty and concerns regarding onerous reporting and other compliance obligations. An organization operating in multiple jurisdictions or sectors will benefit from the harmonization of regulatory and legal expectations regarding their AI systems so they can be confident in the design of a single set of responsive protocols and controls and project the corresponding costs and benefits. Aligning and clarifying these requirements enables businesses to address them efficiently, promoting consistent AI leading practices while facilitating greater investor and consumer confidence and trust. We also believe that the overall innovation opportunities for AI can be markedly enhanced by providing clarity with respect to the application of liability and copyright laws, among other common areas of ambiguity. Once established, regulatory frameworks will need to be periodically revisited to help ensure their continued fitness for purpose in a rapidly evolving area.

2. Incentivizing transparency to build trust

Trust is paramount for widespread acceptance of AI, particularly at the current pace of technological change. Incentivizing developers to enhance appropriate visibility into AI processes — such as through voluntary disclosures on certain AI deployments — can maintain forward momentum without necessitating additional regulations. Developers may find it helpful, for example, to think of transparency on a continuum. As the degree of risk or potential impact increases, including when the risk involves users' personal or proprietary data, increased transparency may engender additional trust and confidence. In practice, this would necessitate identifying specific points across the AI systems

development and deployment spectrum, developing transparency parameters around each of these points, and publishing related methodologies or performance metrics to offer meaningful insight without exposing competitive information. This approach not only streamlines compliance but also preserves a stable policy environment that fosters trust and aligns with the rapid pace of AI innovation.

Transparency around AI's use may advance public trust and understanding, but confidence in the information disclosed by companies can be enhanced by independent, third-party assurance. Public company auditors possess (1) expertise in information systems and assurance methodology according to generally accepted standards, (2) robust licensure requirements, and (3) a system of quality management mandated under the standards of the American Institute of Certified Public Accountants and Public Company Accounting Oversight Board. These attributes combine to credential public company auditors to provide a high level of assurance and substantially enhance trust.

Whether internal testing and certification or external third-party assurance is required should be determined by the applicable governing agency and the extent of such assurance scaled based on an assessment of the level of confidence expected by the stakeholder and the consequences of misinformation or disinformation.

3. Supporting new stakeholder partnerships for greater efficiencies

Incentivizing new partnerships among businesses, the public sector, academic institutions, and industry groups can yield targeted approaches that directly address private sector needs while maintaining a cohesive regulatory environment that sets the global example for how trust in AI systems is built and maintained. For example, joint advisory councils can promote real-time feedback, reduce duplicative requirements, and accelerate best-practice adoption in a way that enhances innovation and reduces inefficiencies. Proactive collaboration also fosters alignment on technical standards, driving greater trust in AI solutions. In turn, these approaches can build a stable policy landscape that supports rapid innovation and strengthens US competitiveness.

Conclusion

PwC supports establishing a national AI action plan that fosters innovation and recognizes AI as a critical pillar of economic growth. Policies that provide clarity for developers, deployers, and end-users — and promote transparency and trust with respect to AI development — will help drive responsible technological transformation and build confidence among stakeholders.
