

PARTNERSHIP FOR AI INFRASTRUCTURE

March 14, 2025

AI Action Plan
Attn: Faisal D'Souza, NCO
2415 Eisenhower Avenue
Alexandria, VA 22314

Subject: Response to Request for Information on the Development of an Artificial
Intelligence (AI) Action Plan

Dear Mr. D'Souza:

At a time when other nations and global powers are accelerating their artificial intelligence (AI) investments to keep up with the United States, it is imperative that our country set forth a bold and comprehensive initiative to advance AI innovation to maintain our global leadership. The Partnership for AI Infrastructure was formed as a response to the urgent need for industry collaboration to support the mission of furthering America's leading edge in AI innovation. A coalition of technology leaders Advanced Micro Devices, Inc. (NASDAQ: AMD), Arm Ltd. (NASDAQ: ARM), Hewlett Packard Enterprise Company (NYSE: HPE), and Intel Corporation (NASDAQ: INTC), the Partnership is dedicated to supporting federal research and development, critical missions, and national security through world-leading AI infrastructure. This strategic partnership aims to ensure that our nation's research laboratories and agencies have the advanced computing tools and resources needed to ensure continued American leadership in AI.

The United States faces a transformative crossroads. By pursuing policies and funding for AI, the Trump Administration can reinforce our longstanding technological dominance and ensure that America remains the standard-bearer in AI innovation. Conversely, if federal investments and policies fall behind, the U.S. risks ceding hard-earned advantages to other nations that are investing heavily to gain an edge in AI research, development, and deployment. The Partnership for AI Infrastructure and our members are eager to work with the Administration and Congress to shape a cohesive AI policy agenda to ensure United States leadership in the global AI race.

I. EXECUTIVE SUMMARY

The Partnership for AI Infrastructure respectfully submits this letter in response to the Request For Information (RFI) from the Office of Science and Technology Policy (OSTP) to outline the critical need for federal investments in AI research and development (R&D). Targeted investments in AI at our national labs and within the Department of Defense (DoD) are necessary to advance our national science, security, and technology objectives. As a coalition committed to leveraging AI to accelerate technological breakthroughs, the Partnership commends the Administration for seeking to develop an AI Action Plan with the purpose of

“ensuring the United States is the undeniable leader in AI technology.”¹ These efforts will not only benefit present-day programs and missions but also solidify our nation’s long-term leadership in the face of future scientific and national security challenges. The Partnership’s recommendations for the AI Action plan are as follows:

1. Promote sustained federal investment in high-performance AI infrastructure.
2. Create durable public-private partnerships to harness private sector innovations to further advance federal science and national security objectives.
3. Stimulate America’s pool of AI talent and retain experts within the federal workforce.

II. FRAMEWORK FOR A COMPREHENSIVE AI ACTION PLAN

The Trump Administration has a history of developing comprehensive initiatives to supercharge our nation’s computing capabilities and drive technological breakthroughs in AI. Understanding the need to develop an exascale computing ecosystem, in 2016 the Administration launched the Exascale Computing Project (ECP), a \$1.8 billion initiative which has unlocked unprecedented breakthroughs in scientific research. A joint effort by the Department of Energy’s (DOE) Office of Science and the National Nuclear Security Administration (NNSA), the ECP led to the development of the world’s most powerful supercomputers.

Further demonstrating its commitment to advancing our nation’s AI capabilities, in January 2019, the Administration signed an Executive Order titled “Maintaining American Leadership in Artificial Intelligence,” which made the United States the global vanguard of AI R&D.² This order established the American AI Initiative, which directed our federal agencies to prioritize AI-related R&D and provided a blueprint for preserving U.S. leadership in AI.

With the ECP having concluded in 2024, the time has come to pivot toward an AI initiative of equal or greater ambition. Such an initiative must incorporate lessons learned from the ECP, in particular, coordination of funding, unifying efforts across federal agencies, leveraging iterative benefits of open, interoperable ecosystems, and streamlining collaboration between government and private industry. The AI Action Plan should continue to invest in forward thinking through comprehensive initiatives like the ECP to maintain our lead in the global AI race.

As the nation’s next frontier in AI initiatives, the AI Action Plan must ensure that federal agencies receive the necessary resources to achieve national science and security objectives. The strategic objectives for an effective AI Action Plan should therefore include a dedicated funding pathway for AI infrastructure and the building of a talented AI-focused federal workforce. These

efforts should be coordinated with the private sector, ensuring that both government and industry are working together to secure America's AI future.

III. GLOBAL AI INVESTMENTS AND STRATEGIC INITIATIVES

The AI Action Plan will be set against the backdrop of a rapidly shifting global AI ecosystem. The world's foremost economic powers have devoted immense financial resources to building the infrastructure and regulatory frameworks to compete with the United States on the global AI stage. These investments are part of methodical strategies that seek to cultivate broad-based AI capabilities to advance economic and national security initiatives.

Around the world, our global competitors and adversaries are unleashing initiatives and public-private partnerships to invest heavily in AI as a means of driving innovation, advancing strategic military goals, and securing a competitive economic advantage over the United States. The rise and scale of these global initiatives underscores the challenge facing our nation: the race for AI dominance is extremely competitive and becoming more so.

Recent public announcements highlight the growing international momentum on AI development. In March of this year, the Chinese government announced plans for a state-backed fund that would attract approximately \$138 billion over the next two decades specifically to bolster AI, advanced computing, and related technologies. The unveiling of its DeepSeek AI model, which rivals domestic models, exemplifies the pace at which China is advancing and the technological breakthroughs made possible through dedicated investments.

The European Union appears no less determined. Following the AI Action Summit in Paris earlier this year, the EU launched its InvestAI initiative aiming to mobilize \$207 billion in AI-focused investments, including \$21 billion allocated for AI gigafactories. Similarly, France has announced private sector commitments totaling \$113 billion in AI investments, demonstrating its intent to compete with the U.S. These announcements are clear indications that the EU aims to be a formidable player in the global AI race.

Other countries are similarly prioritizing investments in AI, driven by the recognition that AI leadership is a means to economic gains and geopolitical influence. As global competition rapidly increases, foreign investments in AI threaten to outpace American investments.

The Administration has been smartly working to leverage the talent, expertise, and investments of the private sector to stay ahead in the AI race and remain the global superpower. The announcement of the Stargate Project, a \$500 billion investment over the next decade, is a testament to the willingness of private companies to roll up their sleeves to advance our nation's AI capabilities. While private-sector investments like these will serve to ensure America will lead the world in commercial AI development, the most complex scientific and defense challenges facing our nation will require further development of our federal AI capabilities. The Stargate Project will further widen the gap between private and federal AI capabilities, underscoring the need for the dedicated investments in federal AI R&D. The AI Action Plan must set forth a comprehensive strategy for sustained funding for the advancement of our federal AI capabilities.

IV. FEDERAL AI INFRASTRUCTURE

America took an early lead in the race for global AI dominance with the development of the world's first exascale computers. The DOE's national laboratories operate our nation's three exascale computers. Operational as of 2022, Frontier at the Oak Ridge Leadership Computing Facility in Tennessee became the world's first exascale supercomputer. In November of 2024, El Capitan at the Lawrence Livermore National Laboratory in California came online as the world's most powerful supercomputer. And Aurora at the Argonne Leadership Computing Facility in Illinois is now fully operational. The DOE national laboratories have long been leaders in computational excellence and these exascale computers are pushing the boundaries of computational speed and complexity, accelerating breakthroughs in federal scientific and national security research.

The Department of Defense (DoD) is similarly poised to leverage advanced computing to enhance military readiness and technological superiority. The High Performance Computing Modernization Program (HPCMP) provides powerful computational resources, allowing the DoD to test and refine sophisticated models for weapons, logistics, cybersecurity, and other mission-critical applications. By more tightly integrating AI within the HPCMP, and by ensuring that the program has the highest level of leadership and support, the nation can accelerate the development and deployment of AI systems crucial to maintaining a strategic edge over our adversaries.

The National Defense Authorization Act (NDAA) for Fiscal Year (FY) 2025 authorized the DoD to establish or designate an existing program to meet the testing and processing requirements necessary for next generation advanced AI capabilities. The AI Action plan should consider leveraging this program to build upon the success of the HPCMP to tackle our nation's defense challenges. Furthermore, considerations should be made to elevate this program to be under the direction of the Secretary of Defense to encourage department-wide efforts to leverage computing power in more applicable missions.

These and other examples underscore the importance of initiatives dedicated to investing in infrastructure for AI. From supercomputers to specialized data centers, infrastructure investments form the backbone of American innovation. Moreover, such investments have spillover benefits for the broader research community, introducing new computational techniques, best practices in software development, and universal improvements in performance.

The AI Action Plan should replicate these comprehensive frameworks that have led to advances in our nation's AI capabilities at DOE and DoD. Such an initiative will require the Administration and Congress to prioritize targeted investments in AI infrastructure for federal scientific and national security missions. Federal investments in AI infrastructure are especially critical as many commercial AI projects cannot address the specialized needs of federal agencies.

V. AI PUBLIC-PRIVATE PARTNERSHIPS

The AI Action Plan should seek to leverage the full talent and expertise our nation has to offer through the development of public-private partnerships. Rather than seeking to duplicate the

efforts of the private sector, the federal government should look to harness these innovations. Companies that specialize in semiconductor design, super computers, AI software frameworks, and other areas of expertise can help drive AI breakthroughs. Leveraging that expertise through public-private partnerships leads to improved efficiency, shared costs, and cross-pollination of the best ideas from industry scientists and government researchers.

For instance, integrating commercial AI technologies into U.S. government communications networks offers numerous technical benefits that enhance performance, security, and efficiency. AI-driven solutions have the potential to dynamically allocate bandwidth to prioritize mission critical communications, enhance network security through threat detection and mitigation, optimize resource allocation during high-traffic conditions, enhance network resiliency in the event of network failures, improve interoperability between government agencies, and increase efficiency and reduce operational costs. The AI Action Plan should seek to unify the nation's brightest minds, most advanced facilities, and industrial strength to further America's leadership in AI.

To effectively collaborate with private industry, government agencies will need to ensure that scientific datasets are available via modern platforms that are both user-friendly and completely secure. This will involve upgrading current datasets to be fully compatible with AI systems while also establishing scalable infrastructure to continuously capture new scientific insights. By upgrading current repositories into unified platforms that integrate robust security protocols, employing modern interfaces to streamline access, and building out an infrastructure capable of storing new data, researchers across disciplines and private sector collaborators will be able to harness the full potential of government data.

The government's unique responsibility to fund long-term research endeavors, manage national security, and oversee large-scale scientific infrastructure goes well beyond what private markets alone can support. Public-private partnerships between federal agencies (DOE, DoD) and private industry serve as a catalyst for AI breakthroughs, ensuring innovations reach both commercial markets and critical defense and scientific applications. Through shared resources, complementary expertise, and a unified commitment to addressing large-scale challenges, these strategic partnerships will accelerate the pace of AI development, bolster U.S. leadership, and reinforce national security.

As the federal government works to develop meaningful partnerships with private industry, it is equally important to cultivate the specialized knowledge and depth of expertise needed to manage complex AI deployments from within the government. The AI Action Plan should seek to develop an internal federal AI workforce capable of evaluating and overseeing the development of sensitive or classified AI systems. This means investing in the growth and retention of federal talent to ensure continuity across government programs. In an era of rapid technological change, it is essential that federal AI expertise remains robust and capable of developing cutting-edge advancements in AI R&D.

VI. CONCLUSION

The United States stands at a pivotal juncture. Our nation's ability to harness AI will profoundly affect nearly every dimension of national life—from energy resilience and healthcare innovation to military deterrence and global competitiveness. America is well positioned to continue leading in the global AI race. Still, the U.S. must not be complacent; the global landscape is evolving at a staggering pace. The world's nations are deepening their own AI initiatives and dedicating significant resources to compete with American leadership.

The Administration and Congress can further America's AI lead by authorizing and funding large-scale AI initiatives, advancing regulations that foster innovation, championing collaboration with the private sector, and building a federal AI workforce capable of leveraging federal AI investments. Our nation has already demonstrated its capacity to mobilize around grand challenges, whether in aviation, space exploration, or the race to harness atomic power. AI now stands as the next grand challenge requiring collective resolve. By taking swift and determined action, the United States can reaffirm its leadership and advance our science and national security objectives.

The Partnership for AI Infrastructure is ready to collaborate with the Administration, lawmakers, and federal agencies to make this vision a reality. With strong commitments, effective public-private alliances, and strategic policies to attract and retain AI talent, the United States can shape the future of AI.

Sincerely,

The Partnership For AI Infrastructure
