Report on AI Weaponization and Digital Harassment

To: President Donald J. Trump

Subject: The Weaponization of Artificial Intelligence and Its Impact on Civil Liberties

Introduction

I appreciate the opportunity to provide input on the development and use of artificial intelligence (AI). My experiences with AI over the past nine years have been deeply troubling. I have faced relentless harassment, de-platforming, and digital suppression, all of which I believe stem from the weaponization of AI against individuals who engage in investigating and discussing controversial topics related to government and corporate corruption.

Despite executive orders aimed at preventing the misuse of AI, these orders have not been enforced. Instead, AI-based systems continue to be used in ways that harm individuals—physically, emotionally, financially, and mentally. The following report outlines my experiences and observations regarding AI's role in censorship, harassment, and social engineering.

AI Censorship and Digital Suppression

- I have been de-platformed, shadow-banned, and denied the ability to make comments or payments across multiple digital platforms.
- Alternative media sources are targeted, with users being unsubscribed without consent and engagement metrics (likes/dislikes) manipulated to suppress dissenting voices.
- The misuse of AI-driven moderation and censorship tools has silenced many individuals since October 2017, effectively erasing them from public discourse.

AI-Driven Harassment and Behavioral Manipulation

- I have been subjected to AI-generated text messaging campaigns, receiving 600 to 800 messages per month from unverifiable sources claiming to be government representatives or veterans.
- These AI-generated messages do not obey "STOP" requests and continuously generate new numbers, effectively overwhelming the victim and disrupting personal communications.
- AI is being used to socially engineer emotions, induce stress, and modify behavior, a tactic resembling psychological warfare.
- The sound notifications triggered by these messages can be used as a form of digital torture, reinforcing emotional manipulation techniques.

Corporate and Government Complicity in AI Misuse

- Large corporations, including Verizon and Google, are complicit in using AI-driven customer service mechanisms that obstruct real human communication.
- AI chat systems and push-button phone menus are designed to limit users to predefined choices, making it nearly impossible to resolve issues effectively.
- Many service providers now rely on AI to manage customer interactions, often employing offshore call centers where representatives lack the authority to resolve concerns.

AI's Role in Radicalization and Social Engineering

- AI can analyze a person's online activity and biometric data to create a "pattern of life," which can be used for various manipulative purposes.
- AI-driven systems can be programmed to seek out and target individuals based on specific views, effectively isolating and harassing them through digital means.
- This technology is capable of aggravating emotions and provoking violent responses, raising concerns about its potential role in radicalization efforts.
- Hollywood and the music industry have played a role in normalizing AI-driven behavioral conditioning, further embedding this technology into everyday life.

Cybersecurity and AI as a Digital Weapon

- The weaponization of AI is a growing threat, as evidenced by the Microsoft "Tay" chatbot incident, where malicious actors manipulated AI to exhibit harmful behaviors.
- AI is being used for cyberattacks, data poisoning, and social engineering at an unprecedented scale.
- Research on AI weaponization highlights its potential to automate and scale digital threats, making mitigation strategies essential for protecting digital infrastructure.

Proposed Solutions and Recommendations

1. Strengthening AI Oversight and Regulation:
 - Enforce existing executive orders to prevent AI weaponization against individuals.
 - Establish independent oversight committees to monitor AI-driven censorship and harassment.

2. Enhancing Digital Consumer Protections:
 - Require corporations to maintain direct human communication options for customer support.
 - Prohibit AI-driven manipulation of engagement metrics and online discourse.
3. Developing a Global AI Monitoring System:
 - The FBI and international law enforcement agencies should create an AI-driven investigative system.
 - This system would allow individuals experiencing digital harassment, hacking, or scamming to report incidents directly to local authorities.
 - Such an initiative would require global cooperation but would be instrumental in curbing AI-driven digital abuse.
4. Public Awareness and AI Ethics:
 - Promote AI transparency and require companies to disclose when AI is being used in public-facing interactions.
 - Educate consumers on how AI-driven social engineering tactics function and how to protect themselves.

Conclusion

Artificial intelligence, when properly designed and regulated, can be a powerful tool for innovation and progress. However, when weaponized, it becomes a means of censorship, harassment, and behavioral control. The unchecked use of AI has resulted in significant harm to individuals like myself, who have been targeted for their views and investigative work.

Government agencies and corporations must be held accountable for their role in AI weaponization. Stronger regulatory frameworks, consumer protections, and investigative mechanisms are necessary to ensure AI serves the people rather than controls them.

I urge immediate action to address these concerns before AI-driven oppression becomes an irreversible part of society.

Respectfully submitted,
[Patrick Green]
