Phillip Masterson

To whom it may concern, I would like to submit a comment regarding the development of the AI Action Plan as requested in the recent RFI. As an Algorithm Scientist working at a semiconductor metrology company that regularly conducts business with TSMC, Intel, Samsung, and other industry leaders, I have a front-row seat to how US policy impacts the semiconductor industry and, by extension, AI development. In light of my experience, I have several recommendations: First, I strongly recommend implementing a lightweight, targeted reporting system that focuses on the capabilities of the most advanced AI systems. Given the speed at which this technology is advancing, it is vital for the current administration to have a clear picture of the latest developments, particularly regarding ways in which they could pose a threat to national security. This would not only help inform policy, but also give your administration a better idea of what threats it may face from future intelligent systems developed by foreign adversaries. Second, for similar reasons, your administration should go out of its way to hire top-tier AI experts who truly understand the technology. A dedicated AI team would help avoid unnecessary bureaucracy, let the government take advantage of new AI capabilities, and provide valuable input into policy. Third, it is imperative to quickly and proactively work with industry to create targeted security standards for frontier AI labs. Current standards are lacking relative to the immense value these companies provide to the US, and hacking and IP theft by adversarial countries pose an urgent threat to our technological lead. The NSA and other key agencies should establish working relationships with frontier labs so they can share their expertise and stay informed on the latest developments. Fourth, export controls on foreign adversaries are necessary to maintain American dominance in AI. Your administration should leave existing controls in place and crack down on loopholes, with particular attention given to H20s and other high-end chips that are not currently covered. Fifth, the US' lead in AI technology should not be impeded by a slowly-growing US electrical grid. Regulatory barriers for all sources of power generation should be streamlined wherever possible. This will keep our AI companies competitive and create thousands of high-paying American jobs. Finally, as someone working in the US semiconductor industry, I can say with confidence that repeal of the CHIPS Act would dampen the recent explosion of growth US chip manufacturing. If reforming the act is necessary, it should be done carefully and with extensive input from industry experts. Thank you for your consideration. I encourage the Trump administration to make robust AI policy a high priority throughout the next four years. Sincerely, Dr. Phillip Masterson
