

Ping Wang

My colleagues, students, and I applaud the President's executive order to remove the barriers to American Leadership in Artificial Intelligence (AI). We do need a national AI action plan and start the actions soon to maintain American leadership in AI. The recent DeepSeek surprise is a wake-up call for our urgent actions. Here are the essential components of the AI action plan: 1. Stable funding for talent development: Sustainable talent development is the key to maintaining long-term US leadership in AI. The US must increase and maintain stable federal investment in AI research and education to motivate, nurture, and support AI talent selection and development on a national scale. 2. Integrate AI with Cybersecurity: AI is increasingly important and used in Cybersecurity defense and offense, which is critical to our national security and economic prosperity in the digital age. In addition, American AI innovations and trade secrets must be secured to maintain our leadership and competitiveness around the world. AI action plans must work in tandem with cybersecurity. 3. Leadership role of NSF: The US National Science Foundation CyberCorps Scholarship for Service (NSF SFS) program has proven successful in leading and organizing cyber talent development with stable funding from Congress. NSF should continue its leadership in AI actions using the tested CyberCorps SFS program model for talent development and is in the best position to integrate AI and Cybersecurity. It would be redundant and not cost-effective to create a new and separate government agency to lead AI actions.
