Response to RFI on the "Development of an AI Action Plan"

Thank you so much for the opportunity to participate in America's AI Action Plan Development!
In my humble view, the following are some of the important policy ideas or focus areas that could be considered while developing an Action Plan that can enhance America's global dominance and leadership in AI Technology Innovation as well as promote human flourishing, economic competitiveness and national security.

(1) AI to combat waste, fraud, and abuse of taxpayer dollars.

AI can be effectively used to monitor & screen transactions real-time, cross-reference data from multiple data sources / departments, track user behavior, uncover hidden connections, analyze historical data, identify patterns and make decisions real-time to ensure funds are allocated for worthy purposes and payments are made to eligible recipients and not to deceased individuals or fraudulent entities for improper usage.

AI can also help in organizing and presenting government data and making it more transparent and accessible to the public in user-friendly formats, which can empower citizens to hold elected and unelected officials accountable. Besides enhancing oversight, these applications can also restore public trust in governance.

(2) AI to control government spending and reduce national debt.

AI can improve efficiency, optimize resource allocation, and identify opportunities to enforce cost-saving measures. AI can help in measuring the effectiveness of government programs, identify inefficiencies, eliminate unnecessary programs, enhance necessary programs, and minimize financial losses. AI can reduce administrative costs across government agencies to a great extent, by improving inter-department communications, streamlining processes and automating routine tasks.

AI can optimize infrastructure investments by analyzing data on population growth, traffic patterns and public necessities. By analyzing IRS data, AI can identify underreported income and fraudulent claims, and thereby improve tax compliance and increase tax revenue without raising taxes. These measures, when implemented effectively, can help government manage the finances

more responsibly and reduce future borrowings, and also the most part of the savings can be reallocated to repay some of the debt.

(3) AI to transform our Immigration System.

AI can transform our immigration system by simplifying and hastening legal immigration process. AI can accelerate visa application processing by automated document reviews and verification. AI chatbots can guide applicants through complex processes, answer questions and reduce application errors. AI can cross-reference data to ensure applications are genuine, identify forged documents, enhance security and reduce delays caused by fraudulent claims. These measures, if implemented effectively, can make legal pathways more accessible and affordable for the worldwide eligible immigrants.

AI can also address the illegal immigration problem by deploying AI-powered drones and computer-vision cameras for boarder surveillance. AI, using facial recognition, can verify and ensure only authorized individuals pass through at border checkpoints. AI can analyze data to predict and prevent illegal activities, such as human trafficking or smuggling.

(4) AI to prevent hacking and data breaches and enhance Cybersecurity.

By continuously monitoring the networks and systems, AI can flag suspicious activities instantly. Unusual patterns or anomalies that might indicate a cyberattack can be easily identified. By analyzing historical data, AI can predict potential attack vectors and system vulnerabilities, and allow organizations to strengthen their defenses in advance. On detecting a threat, AI can automatically and instantly isolate affected systems or block malicious IP addresses, and reduce response time and minimize damage. AI can also improve access control through biometric authentication and adaptive security measures, to ensure only authorized users can access sensitive data and minimize cybercrime.

(5) AI can significantly enhance our counter-terrorism approach.

American lives can be saved by deploying drones in combat situations. AI can seamlessly coordinate communication between computer vision enabled small drones and large drones carrying weaponry, and make autonomous decisions in enemy combats as necessary. AI can also analyze the aftermath of an engagement, providing insights for future missions and improving the overall effectiveness of the AI-powered drone system.

(6) AI for Information Dissemination.

Similar to the White house Press Secretary, an AI enabled system can act as spokesperson to the non-press community (public). Anyone in public having questions, without having to depend on the traditional media or social media, can directly approach the AI system and get answers from the Source of Truth!

Through day-to-day interactions with the worldwide population, AI can analyze the global perceptions of America, identify areas of misconception and provide insights to inform targeted outreach and engagement efforts or provide necessary clarifications or additional information to

promote a more accurate understanding of the country. AI can showcase the "Real America" to the world!

(7) AI can serve as DOGE for American families.

AI can help families optimize their relationships, love, trust, happiness, health, finances, American-Dream and more. Families truly wanting to improve their lifestyles, food habits, spending habits etc. can take help from personalized data-driven AI models and build better relationships with one another in the family and neighborhood. With AI as a friend, guide, philosopher, mentor or coach, anyone can get a personalized little push or encouragement to do better.

I offer my sincere wishes for the successful development and implementation of an AI Action Plan that would advance and solidify America's leadership and global dominance in the field of Artificial Intelligence (AI). I am truly excited!

Sincerely,

Ramesh Pandurangan
