“It is the policy of the United States to sustain and enhance America’s global dominance in order to promote human flourishing, economic competitiveness, and national security”

- President Donald J. Trump, Executive Order 14179, January 23, 2025

Recogni respectfully submits the following policy recommendations for consideration as the Office of Science and Technology Policy (OSTP) develops a comprehensive Artificial Intelligence (AI) Action Plan to sustain and enhance American leadership in AI.

1. AI Performance Measurement and Export Controls

Current export controls, focused solely on single-device performance metrics (e.g., MacTOPS per integrated circuit), are inadequate given rapid annual advancements in silicon technology and the capability to network multiple ICs into supercomputers. Policy frameworks must adopt holistic performance metrics, considering both individual device capabilities and their aggregate performance in networked configurations.

2. Customer Identification (KYC) and Usage Audits

The global reach of cloud providers facilitates broad access to powerful AI computing resources. To mitigate associated risks, regulatory frameworks should require:

- Comprehensive Know-Your-Customer (KYC) protocols.
- Continuous monitoring of AI usage patterns and originating countries.
- Aggregated compute usage limits.
- Regular and transparent reporting to regulatory bodies, independent of physical infrastructure location.

3. Differentiating AI Training from AI Inference Systems

Clear policy differentiation is essential between dual-purpose AI systems (capable of both training and inference) and dedicated inference-only systems. Dual-purpose systems necessitate stringent controls to prevent unauthorized AI model proliferation, whereas inference-only systems, critical for wide-scale AI adoption, require appropriately balanced regulatory frameworks promoting secure and expansive deployment, with potentially fewer restrictions based on risk profile.

4. Managing Dual-Use Risks of AI Inference Systems

AI inference silicon and systems, versatile across applications such as robotics, drones, industrial automation, military systems, surveillance, and critical infrastructure monitoring, pose significant dual-use risks. Policymakers should establish stringent reporting, tracking, and auditing obligations for manufacturers, mandating detailed customer disclosures and end-use assurances to minimize the risk of misuse.

5. Disposal and Secondary Market Control of AI Silicon

Despite common perceptions, depreciated AI systems (typically 3-5 years old) remain capable for AI model development, particularly when clustered. Regulatory policies must require secure disposal and destruction procedures for retired AI silicon and prohibit their uncontrolled resale on secondary markets to unauthorized entities.

Conclusion

Maintaining American leadership in AI demands vigilant and adaptive regulatory frameworks that balance innovation and security. Recogni remains committed to supporting OSTP's efforts and welcomes further dialogue to refine these critical policy areas.

Respectfully,

R. K. Anand
