Hello,

I'm a professional artist who has worked in tech/games and other fields for nearly two decades. I'm writing to vehemently oppose the AI Action plan, which would allow AI companies to use copyrighted materials for training and other genAI purposes. There are a myriad of reasons this would be catastrophic for the creative sector and broadly the US at large. I'll do my best to list these:

1. Negating copyright law is wrong and will harm all sorts of creators. By allowing the AI companies to directly profit from non consensually scraped/trained works (images, music, written text, voicework, etc) the government is condoning stealing from the pockets of professionals who have trained for years to produce market valuable, high quality works. We are already seeing job loss in creative fields. GenAI reproducing images in the exact, recognizable style of a particular illustrator or the voice of a particular actor, which it is only able to do by consuming those original works, is theft, and could make creative careers unsustainable.
2. Using the training of AI as an excuse to negate copyright is a dangerous slippery slope. Even the code written to create these AI technologies could be stolen and reproduced by someone else (even another country) if someone simply says it's for training purposes. If there is no protection or sustainability for the people and companies who create products of value, Americans will simply stop creating, as they would not be able to afford to do so when an AI will just try to reproduce their work anyway. Considering the massive soft power the US has through creativity- film, video games, books, music, technologies, etc, it would be a catastrophic loss to the economy to stifle the production of these works, which from what we've seen of generative AI so far, would not truly be able to replace at the same level of quality or ingenuity.
3. Generative AI is not the hyper-growth leading tech the companies have been hyping it up to be. Billions are currently being invested in a tech product that, thus far, has broadly not been embraced by consumers/creators, has not streamlined or made anyone's work easier (except for students cheating on their homework), and requires the energy of a small country to run. Microsoft has been the leader in AI investment and cramming it into their products, but read the news and notice that they have recently quietly pulled back their investments. Why would they cut back when they had been so bullish on genAI being the future? Could it be that they realized there is no actual profit to be made on a tech that requires trillions to run at scale but has few actual users? It seems like bad business on the government's part if they were to allow these AI companies to destroy other profitable sectors of our economy for a technology we are TOLD will be this game changing magic profit engine, but does not actually exist yet and may never.

I am not against advances in technology, but I believe the tech companies would find more

profit and success by designing things that actually help people, make productions run smoother, and take care of dirty, dangerous, or generally unpleasant work instead of simply bleeding our already robust and globally adored creative industries by stealing their work or incentive to invent.

Thank you for accepting comments on this matter.

Sincerely,
Robin Sevakis
