Rosa Dierks

If not already in place, AI and data mining technologies should be used to update technologies in all federal government departments and agencies. Technologies that are compatible across the executive branch for processing and tracking all budgets, contracts, grants, and all fund transfers should aim to accomplish efficiency and accountability metrics. Likewise, OPM could implement such technologies for performance reviews and mission goals for the federal workforce in accordance with specific mission constraints and requirements. Public administrators and technologists as well as managers with private sector experience do not always communicate with the same kind of understanding and appreciation of how technology can improve performance. Bringing together small task forces including all three groups to implement an institutional cultural change across the executive branch can serve to create a results-oriented ethos of public sector "entrepreneurship." The deeper the institutional memory in any bureaucracy, the greater the resistance to change. The status quo is not sustainable. Transformational change in our public institutions will require effective technological change, which might well serve to restore trust in the critical functions of our federal government.
