

**Request for Information on the Development of an Artificial Intelligence (AI)
Action Plan, 90 Fed. Reg. 9088 (Feb. 6, 2025)**

Submission of the Software & Information Industry Association (SIIA)¹

March 14, 2025

The Software & Information Industry Association (SIIA) appreciates the opportunity to respond to the Trump Administration's Request for Information on the Development of an Artificial Intelligence (AI) Action Plan "to promote human flourishing, economic competitiveness, and national security."²

SIIA's nearly 400 members, including creators of software and platforms used by millions worldwide, are at the forefront of artificial intelligence innovation. Our member companies range from global leaders in AI models and applications, companies specializing in data analytics and information services, academic and scientific publishers, education technology companies, and the global financial information and market data community.

SIIA commends President Trump for prioritizing the development of an AI Action Plan to ensure that the United States maintains and strengthens its position as the global leader in AI.³ Actions taken during President Trump's first term, including the seminal 2019 executive order, *Maintaining American Leadership in Artificial Intelligence*,⁴ helped to foster significant advancements in AI models and applications and fortify American leadership globally. Continued leadership in AI requires proactive federal policy to harness the remarkable potential of AI-driven technologies and advance U.S. economic interests while responding to new geopolitical challenges and national security risks.

¹ This document is approved for public dissemination. The document contains no business-proprietary or confidential information. Document contents may be reused by the government in developing the AI Action Plan and associated documents without attribution.

² Executive Order 14179, [Removing Barriers to American Leadership in Artificial Intelligence](#) (Jan. 23, 2025).

³ Executive Order 14179, [Removing Barriers to American Leadership in Artificial Intelligence](#) (Jan. 23, 2025).

⁴ Executive Order 13859, [Maintaining American Leadership in Artificial Intelligence](#) (Feb. 11, 2019).

Our recommendations focus on unlocking and supercharging American innovation and advancing American national security and economic interests. We organize our recommendations in five categories: (1) Governance, (2) Global Leadership, (3) Workforce and Education, (4) Infrastructure, and (5) Federal AI Adoption. Each of these domains requires concrete policy actions to sustain America's AI dominance while safeguarding the public interest. We commend the Administration's early prioritization of AI policy.

(1) Policy Actions to Promote Innovation through Smart Governance

Realizing the potential of AI and unleashing innovation also requires attention to governance. We define governance to include practices, policies, frameworks, and technical standards in addition to formal laws and regulations. SIIA has long recommended a light-touch approach to laws and regulations, and an emphasis on voluntary frameworks, best practices, and market-driven solutions – as President Trump called for in the 2019 AI executive order – that will reinforce “trust and confidence in AI technologies.”⁵ Actions taken by the federal government will have an impact on state AI policy and on AI regulatory efforts overseas. The AI Action Plan should advance measures to preempt onerous and inconsistent (whether confusing or conflicting between states or federally) state legislation and support America's AI leadership on the global stage. Doing so will advance adoption of American AI systems and applications domestically and around the world.

SIIA continues to encourage the Administration to pursue a light-touch, risk-based approach to AI governance grounded in standards and best practices. This will ensure the United States addresses real risks while preserving the innovation environment that has made America the world leader in AI. By resisting overbroad or premature regulation, the Administration will foster an atmosphere where companies can innovate with confidence that compliance burdens will not arbitrarily derail their efforts. Facilitating risk-based, innovation-friendly approach is a cornerstone of maintaining our global AI leadership.

⁵ Executive Order 13859, [Maintaining American Leadership in Artificial Intelligence](#) (Feb. 11, 2019).

Formalize the American Model of AI Governance

- Prioritize Standards and Transparency Measures for AI Governance. The AI Action Plan should prioritize voluntary, risk-based frameworks and technical standards as the bedrock of AI governance for U.S. companies. The government should encourage voluntary frameworks, industry best practices, and sector-specific guidelines that can adapt to the varied contexts in which AI is deployed. As part of this, the AI Action Plan should empower NIST to continue to be a focal point for public-private collaboration and the development of risk-based guidance. NIST's leadership has proven to be extremely influential in improving the quality of U.S.-developed AI models and in shaping the direction of governance in international forums and in foreign nations.⁶
- Focus on Risk-Based Oversight: Any regulatory intervention should be proportional to the level of risk posed by a particular AI application and should only be undertaken when a gap has been identified in existing laws and regulations. Many AI related concerns are already addressed in existing law, however high-impact use cases may warrant guidance or standards specific to that sector. Conversely, "low risk" uses should face minimal if any regulatory burden. These use cases must be articulated in sufficient detail for clarity to avoid over-capture, while leaving some flexibility for evolving and edge case examples. This calibrated approach aligns with existing industry approaches. We applaud the bipartisan consensus emerging in Congress (such as the recommendations of the House Bipartisan AI Task Force) that emphasizes building trust in AI through targeted measures rather than broad mandates.
- Invest in Measurement Science. We recommend that the AI Action Plan direct the Secretary of Commerce to advance NIST's efforts to develop measurement science applicable to AI technologies. This work has received considerable attention globally, but much more is needed to advance the science needed to develop robust technical standards to guide future AI models and applications, consistent with Secretary Lutnick's vision, as stated in his confirmation hearing, to establish the "gold standard" for AI as the United States has done for cybersecurity. Continuation of public-private engagement will be important.
- Promote Sector-Specific AI Guidelines: SIIA supports tailored, sector-specific policies to address unique challenges in AI development and deployment. Different sectors face unique challenges with AI. We recommend that various agencies work with stakeholders to issue sector-specific guidelines or

⁶ National Institute for Standards and Technology, [AI Risk Management Framework](#) (January 26, 2023).

standards for AI, rather than one omnibus AI regulation. This ensures expertise-driven oversight where needed, and no unnecessary rules where risks remain low. A central body in the federal government, located at NIST or within OSTP, should serve as a coordinator to reduce overlap and ensure consistency. We continue to support Chief AI Officers at each agency.

- Seek, As Needed, Targeted Use-Based Restrictions: Many areas of potential concern involving the application of AI are adequately met by existing legal frameworks.⁷ Nevertheless, as this Administration has recognized, AI has enabled new categories of harm that require targeted approaches. Case in point is the scourge of deepfake pornography. SIIA is a supporter of the *Take It Down Act*, a measure renewed in this Congress that the First Lady has championed, as this sort of targeted approach.⁸

Lead on National Security Testing for Frontier Models

- Establish a Focal Point for Public-Private Collaboration on Frontier Model Security Testing and Evaluation: SIIA has been a strong advocate for authorizing a body in the federal government to lead a coordinated approach to AI security issues with a focus on frontier models. Legislation in the 118th Congress, including S. 4178, the *Future of AI Innovation Act* and H.R. 9497, the *AI Advancement and Reliability Act*, proposed to establish a center in the Executive Branch to lead a coordinated approach and public-private collaboration on AI security, with a focus on frontier models. We recommend the AI Action Plan endorse and help to codify such a body. Doing so is essential to avoid ceding global leadership to foreign jurisdictions and to preempt state legislation that, in the absence of clear federal attention, may lead to onerous regulations and liability risk that will kneecap AI innovation.
- Support a “Home Testing” Principle with Like-Minded Nations: Industry has concerns that foreign nations may seek to impose safety or security requirements on AI models or AI applications developed or deployed by U.S.-based firms notwithstanding conformity with voluntary AI security standards endorsed by the United States. Indeed, we are already seeing signs of this. If this loose arrangement is allowed to continue, it may restrict the ability of U.S.-based companies to access foreign markets, whether due to legitimate concerns with the AI models or applications or to privilege foreign forms. The AI Action Plan should direct appropriate officials in Executive Office of the

⁷ See, e.g., [Joint Statement on Enforcement Efforts Against Discrimination and Bias in Automated Systems](#) (April 25, 2023).

⁸ S. 146, [Take it Down Act](#) (119th Cong.); [Readout from First Lady Melania Trump's Roundtable Discussion on Online Protection and the Take it Down Act](#) (Mar. 3, 2025); SIIA, [Statement on Take it Down Act](#) (Dec. 4, 2024).

President, Department of Commerce, and Department of State to negotiate an understanding with like-minded nations that have established institutes for AI security testing to defer to testing undertaken by an AI developer or deployer's country of origin, unless otherwise agreed to by that AI developer or deployer.

Advance a Unified, National Approach to AI Policy

- Federal Preemption: State legislatures are actively looking to pass broad measures to regulate high-risk AI across the economy. Though only Colorado has thus far enacted a broad AI act, we are likely to see at least half a dozen more laws this year on both frontier model safety and high-risk AI. These will raise a host of conflicts – from definitions to enforcement to scope – that will make the “privacy patchwork” seem simple in contrast. SIIA has concerns that proliferation of state legislation will impose onerous and inconsistent regulatory and product approval burdens on industry that impede innovation, create untenable compliance challenges, hinder adoption, and make it harder for consumers, business, and government to reap the benefits of the AI revolution. SIIA urges the Administration to formalize its approach to AI policy, oversight, and frontier model security, and to work with Congress to draft and pass a federal law to preempt state legislation on AI safety and security. SIIA also urges federal efforts to support harmonization of state approval and procurement rules that create 50+ review rubrics, application restrictions, and bureaucratic processes that will create duplicative but often inconsistent and even conflicting requirements that may unnecessarily slow adoption.

Advance Intellectual Property Policies that Support Innovation

- The Current IP Framework Fuels AI Innovation: SIIA urges the Administration to affirm that existing intellectual property laws are sufficient to govern AI technologies, and to resist calls for sweeping new IP restrictions that could hamper AI development. America's copyright, patent, and trade secret laws have a long track record of adapting to new technologies, and they are well suited to do so for AI as well. Indeed, American companies large and small are investing heavily in AI under the current IP framework – a sign that the incentives to innovate remain strong. The Administration should preserve this environment. We encourage continued dialogue between policymakers, industry, and the creative community on specific IP concerns, but believe the default approach should be to apply current law to new tech. By doing so, we maintain the legal continuity and predictability that underpin U.S. technological leadership.
- Clarify Patent Procedures: It is critical that the administration protect and improve upon the U.S. Patent and Trademark Office's (PTO) Inter Partes Review program to permit efficient review of AI patents that did not meet the

statutory requirements. Some estimate that the agency error rate is as high as 40 percent for software. Increasing patent applications around AI will lead to mistakes in the same way that invalid claims around ordinary activity “on a computer” improperly burdened both the courts and our members’ research and development. To avoid creating the same problem in AI development, businesses should have access to the inter partes procedure for those patents that they have shown are of dubious quality (as the statute demands). Merit *must* be the touchstone of that review, and overbroad discretionary denial (such as that set forth in the *Fintiv* case) should be avoided.⁹ Similarly, to be effective, the process must be properly staffed—PTO’s Patent Trial and Appeal board should continue to be maintained with the user fees that currently fund it. Otherwise, foreign entities can use these poor-quality patents to hamstring American AI development by draining resources better spent on research and development and subjecting trade secret information to discovery and creating innovation bottlenecks for businesses large and small.

- Protect Access to Publicly Available Information: Over the past several years, we have seen concerted efforts at the federal and state level to limit the use of publicly available information (PAI). While intended to restrict the ability of “data brokers” to sell personal information to third parties, in practice these restrictions would have a significant impact on innovation by limiting the use of PAI to train AI models and assist in law enforcement and national security needs.¹⁰ In seeking to limit bad actors, policymakers should be sure that they do not hamstring legitimate uses of AI in law enforcement, fraud detection, and similar valuable activity.

⁹ See [Apple Inc. v. Fintiv, Inc.](#), Case IPR2020-00019 (Mar. 20, 2020).

¹⁰ Paul Lekas and Anton van Severter, [The American Privacy Rights Act’s Hidden AI Ban](#), *Techdirt.com* (Oct. 29, 2024).

(2) Policy Actions to Advance American AI Leadership Globally

Maintaining U.S. global AI leadership means competing and winning in the international arena; therefore, we must ensure U.S. companies can thrive globally. Many of our member companies operate globally, and we feel that minimizing barriers will empower them to continue doing so. Whether through trade negotiations, diplomatic engagement, or strategic use of U.S. influence in global forums, we urge the Administration to be an advocate for fair treatment of American AI.

SIIA believes that advancing American AI leadership globally requires a two-pronged approach, one that both promotes American AI and one that protects the United States from national security threats. We provide the following recommendations to achieve this.

- Use Diplomacy to Advance U.S. Soft Power: AI technologies are not value free. The American AI industry has built models and AI-driven technologies that by and large reflect core views about security, censorship, and surveillance that readily differentiate those AI tools from a competitor such as DeepSeek. We believe the United States is on the cusp of a moment not unlike the one that Huawei presented during the prior Trump Administration. Then, the Administration used the tools of statecraft to build a coalition of over 60 countries committed to supporting digital trust and addressing tech-driven threats by malign authoritarian actors.¹¹ U.S. national security and economic interests demand similar leadership today. Accordingly, we recommend that the AI Action Plan direct the State Department to lead a similar effort focused on AI and other emerging technologies.
- Targeted Export Controls: To maintain our edge over strategic rivals, the U.S. must carefully calibrate its export control policies. SIIA supports the Administration's focus on denying adversaries (namely China) access to the most advanced semiconductor chips and manufacturing equipment used for AI. However, we caution against broad new controls on AI software, cloud services, or trained AI models, which would be difficult to enforce and could handicap U.S. industry more than our rivals. SIIA has previously voiced that existing proposals to restrict cloud computing services or AI model access would pose unworkable implementation challenges and will give China a leg-up in the global AI competition.
- Champion American AI Globally and Defend Against Unfair Foreign Barriers: The U.S. must pair its domestic AI strategy with assertive international engagement to ensure American AI firms can compete on a level playing field

¹¹ U.S. Department of State, [Fact Sheet: The Clean Network Safeguards America's Assets](#). (Aug. 11, 2020).

worldwide. SIIA recommends that the Administration push back on foreign regulations that unfairly target U.S. tech companies. American leadership in AI is not only about being the best at home, but also about setting the “rules of the road” for AI internationally in a way that reflects democratic values and open markets. To accomplish this, the AI Action Plan should recommend that the President direct a small number of officials to lead in tech diplomacy, create a public-private advisory board, and advance a consistent message reflecting input from industry.

(3) Policy Actions to Cultivate the Workforce and Leaders of Tomorrow

AI has the potential to help personalize learning at scale, assist teachers in identifying and remediating where students need help, and open up new pathways for AI engineering and other skills development. It also poses challenges, but we believe a combination of policy guidance and public-private collaboration will maximize AI's benefits for learners of all ages. By investing in AI for education and workforce training, the U.S. can both cultivate the next generation of AI leaders and users, leverage AI to increase learning access and success, and ensure that our workforce can adapt to AI-driven changes. In doing so, we will secure a future where the American workforce can become the most AI-proficient in the world, driving productivity and growth.

- Prepare America's Workforce and Students for an AI Future: The transformative power of AI should be harnessed to strengthen education and build the workforce of tomorrow. Schools should integrate AI and digital literacy into both education and workforce development programs to equip citizens with the knowledge and skills to thrive in the economy of tomorrow and strengthen U.S. economic and national security in the long term. The AI Action Plan should direct the Departments of Commerce and Education to lead in convening education, government, and private sector stakeholders to further develop and support adoption of AI skills standards and provide guidance to education leaders and workforce development programs.
- Facilitate Integration of AI and EdTech in Classrooms: The potential for AI-assisted teaching and learning is extraordinary. The federal government has a unique ability to convene experts and encourage and facilitate adoption at the state and local level across agencies, education institutions, and education and training programs and providers. Highlighting exemplars, funding teacher and trainer professional development in the use of AI and otherwise helping the sector to address questions and concerns can help enhance impact.
- Expand Access to Education Technology and Connectivity: To take advantage of AI, all students must have access to modern technology. SIIA recommends the Administration support programs and funding that will help state and local authorities and education and training institutions to adopt education

technology that incorporates AI. For example, the AI Action Plan should call for continued support for the FCC's E-Rate program that is so critical to ensure schools and libraries have high-speed internet connectivity, as connectivity is the backbone of AI-enabled learning.

- Promote AI Workforce Training and Upskilling: The Administration should support programs to train the U.S. workforce for AI. Further, the Administration should also launch or look to expand programs that use AI to train the U.S. workforce. Public-private partnerships can create apprenticeship programs in AI. With many U.S. employers, and the government, facing AI talent shortages, these steps will both fill high-demand AI jobs and help existing workers transition to new roles in an AI-rich economy. The AI Action Plan should direct the Secretary of Labor to focus on developing apprenticeship programs to prepare Americans for these positions. Ensuring the workforce is adequately skilled in AI will be instrumental to ensuring continued American leadership in AI.
- Support Teachers and Protect Students: Teachers should receive professional development on incorporating AI tools and literacy into lesson plans, assessments, curriculum, and instruction. At the same time, federal policy must reinforce general student and other relevant data privacy and security policies that now protect students and will build public trust when integrating AI into education. This includes recognizing and defining the limited use cases where AI-enabled education and training decisions are high-risk and would benefit from a degree of human oversight.

(4) Policy Actions to Create Infrastructure Needed for Continued AI Leadership

Achieving AI leadership requires massive computational infrastructure – from data centers and cloud computing clusters to the energy grids that power them. The U.S. government should proactively support the build-out of AI infrastructure and ensure our energy policy accommodates the surging demand for computing power. By ensuring that developers have access to the resources, data centers, and electricity they require, the U.S. will provide a foundation on which our AI leadership can continue to grow.

- Expand Energy Supply and Optimize Power Grid: The rapid advances in AI will require energy far outstripping available supply.¹² The AI Action Plan should direct efforts to expand and upgrade U.S. energy capacity. This includes accelerating permits for new power generation and modernizing the electric grid to handle high-density computing loads. The Administration's recent

¹² See, e.g., SemiAnalysis, [AI Datacenter Energy Dilemma - Race for AI Datacenter Space](#) (Mar. 13, 2024); Berkeley Lab Energy Analysis & Environmental Impacts Division, [2024 United States Data Center Energy Usage Report](#) (Dec. 2024).

declaration of a “national energy emergency” to fast-track data center power projects is a bold step in recognizing this challenge. Ensuring accessible and affordable electricity for AI computation will support not only tech hubs but also regional economic development as data center investments spread to new areas.

- Streamline Data Center Development: To keep pace with AI innovation, America must dramatically expand its high-performance computing facilities. This will require streamlined approval and permitting processes for building new data centers and treating them as critical infrastructure. The Administration should explore innovative approaches to public-private collaboration that incentivize the private sector to build and onshore data centers to enable AI growth necessary to dominate this technological category. The AI Action Plan should, among other things, direct the creation of a public-private advisory body to collaborate on concrete measures the federal government should take to advance data center development.
- Support Open Innovation and Research: While the U.S. has an edge in AI innovation and AI research, the federal government must take steps to ensure that the U.S. advantage holds for the foreseeable future. We recommend the AI Action Plan direct steps to promote open innovation and foster research collaboration. This includes creating shared compute and data resources, such as is contemplated by the National AI Research Resource;¹³ making accessible government data sets to drive AI innovation; harnessing the potential of the National Laboratories, including, potentially, through the bipartisan FASST initiative;¹⁴ and supporting the adoption, where appropriate, of open-source AI models.¹⁵

(5) Policy Actions to Accelerate Federal AI Adoption

Overhaul Outdated Procurement Regulations and Processes

A “whole-of-government” effort to embrace AI – underpinned by agile procurement and enlightened IT investment – is essential for U.S. global AI leadership. SIIA urges agile acquisition practices that mirror commercial best practices and streamline how agencies buy and implement AI solutions. Current procurement rules and lengthy contracting cycles often discourage innovative AI startups from bidding on federal projects – as noted in the National Security Commission on AI’s report, “bureaucratic snarls deter companies from working with DoD; it is economically irrational for many startups to even try.”¹⁶ That statement, made in 2021, remains an accurate assessment of the situation today. By modernizing procurement in the following ways, the federal government can rapidly integrate state-of-the-art AI solutions into public-sector missions. Accelerating federal AI adoption not only improves government efficiency and services but also serves as a market signal that encourages domestic AI innovation.

- Simplify and Expedite AI Acquisitions: The AI Action plan should enable pilot programs and rapid procurement mechanisms for AI technologies. This will lower barriers for small, innovative firms and allow agencies to test and deploy AI solutions in months rather than years. We support the Executive Order’s directive to revise OMB’s guidance on AI acquisition to eliminate barriers to AI adoption. The OMB guidance should be amended to focus on truly high-risk systems and enable rapid acquisition and deployment of technologies that fall under that threshold.
- Adopt Commercial Cloud and Hybrid Infrastructure: The AI Action plan should direct agencies to utilize secure commercial cloud services and hybrid government-commercial cloud environments for AI. Commercial cloud platforms provide on-demand scalability and cutting-edge AI tools that can accelerate federal modernization. Policies should promote interoperability standards and hybrid cloud models that enhance resiliency of federal systems while avoiding redundant, siloed infrastructure across agencies.
- Eliminate Barriers for Startup and SME Participation: The AI Action Plan should direct alignment of procurement criteria with industry standards to minimize onerous compliance burdens that disproportionately impact small businesses. As the NSCAI recommended, it will take top-level leadership to focus agencies on adopting new technologies and overcome “antiquated processes.” We urge the Administration to include targeted recommendations

¹⁶ [National Security Commission on AI Final Report](#), at 62 (Mar. 1, 2021)

to Congress to engage in procurement reform that makes it easier for startups and non-traditional vendors to offer AI products to the government.

- Hire AI Talent in Government and Empower Chief AI Officers: Every major agency should have a Chief AI Officer (or equivalent) with the mandate to drive AI adoption and coordinate procurement of AI across the agency. These officials can identify high-impact use cases, ensure staff are trained to evaluate AI offerings, and share best practices government-wide. SIIA supports retaining these roles to provide sustained leadership for federal AI implementation.¹⁷

Accelerate Adoption of AI for National Security Uses

The Trump Administration should also accelerate the adoption of AI for national security missions including at DoD and across the intelligence community. We urge a top-down mandate for rapid AI integration across the Department of Defense (DoD), Intelligence Community, and homeland security agencies. The Administration should direct defense and security leaders to prioritize AI adoption in their plans, budgets, and operations.

To maintain strength and security globally, America's national security and cybersecurity agencies should have the best AI tools at their disposal. We appreciate the Administration's recognition that AI leadership is critical to national security, and we encourage making AI adoption a measured criterion of success in national security programs. By treating AI integration as a strategic mandate, the U.S. will strengthen its security and protect critical infrastructure while further spurring the development of cutting-edge AI technologies domestically.

- Harness AI for Cybersecurity: It is imperative to leverage AI to defend against increasingly sophisticated cyber-attacks on government networks and U.S. critical infrastructure. We encourage federal deployment of AI-driven cybersecurity tools. For instance, AI can automate threat detection and incident response much faster than manual methods.
- Adapt AI for Classified Networks: A critical challenge in deploying AI for national security is ensuring that AI systems can operate effectively at classified levels. Many cutting-edge AI models and applications are currently developed and tested in commercial environments, but transitioning these technologies to classified settings requires significant investment. AI tools used for intelligence, defense, and cybersecurity must be adapted to classified infrastructure, meaning they require secure computing environments, classified data inputs, and rigorous security vetting. However,

¹⁷ Bethany Abbate, [Chief AI Officers Must be Preserved in the Trump Administration](#), *FedScoop* (Feb. 18, 2025).

these adaptations often involve lengthy and expensive processes, from meeting clearance requirements to integrating AI within classified networks. Without dedicated funding, many AI innovations will not transition from concept to operational use in military and intelligence settings. The AI Action Plan should direct DoD, ODNI, and OMB to prepare appropriations requests and advocate with Congress for appropriations to adopt AI broadly within the national security community.

- Invest in Data Quality: The government must also invest in data quality and preparation for national security use cases. AI is only as effective as the data and information it is trained and deployed on, and national security agencies hold vast data sets of information that are often fragmented, unstructured, or inconsistent. To unlock AI's full potential for threat detection, intelligence analysis, and operational decision-making, the government must prioritize large-scale data cleaning, standardization, and structuring efforts. This includes modernizing legacy data storage systems and investing in AI-powered tools that can effectively parse intelligence data for machine learning applications. Without these foundational efforts, AI models will struggle to generate accurate, actionable insights from national security datasets.

Conclusion

SIIA strongly believes that the United States should maintain and extend its global leadership in artificial intelligence by pursuing the policy actions outlined above. We must lead by example – adopting AI within our own government operations, guiding AI's development with flexible governance, using AI to secure our nation, building the infrastructure that AI needs to flourish, training our people to harness AI's potential, protecting the IP regime that underpins innovation, and championing American AI ideals on the world stage. These efforts collectively ensure that AI innovation and economic growth remain at the cornerstone of policy actions.

We appreciate the Administration's commitment to American AI leadership and stand ready to assist in crafting policies that will unlock AI's promise for our economy, society, and security. By taking balanced actions, the U.S. can expand and preserve U.S. leadership in AI which will benefit all Americans.

Respectfully submitted,

Paul Lekas
