Warm greetings to the NITRD and NCO teams!

I want to provide an additional voice as a freelance artist and a software developer in the entertainment industry.

Generative AI was created using legal grey zones with almost non-existent ethical constraints. Most of these data scrapers were initially indirectly funded by private companies even though many of the datasets "claim" to be open source and for public research. I believe Machine Learning and other ventures into AI research are valuable to human life and the technological progression of our country, but want to warn against allowing personal data, copyright, and the work of small businesses and artists from being used license free by companies who seem to create tools and products which replace the value of those hard working American citizens.

The novelty of generative AI in both imagery and text is quickly replaced once users understand the frequency of hallucinations, and the active INTENT by these companies for the products to be used for ill-advised use cases (including historical document reconstruction, law advice, and replacing artists by actively using machines designed to copy them). We live in an era where generated content has actively replaced human content on the internet, and further pollutes political and historical knowledge with believable fake likenesses in voice, video, and verbiage.

I propose that existing copyright be maintained or modified to further protect creative human works, and that generative AI continue to be restricted to items actively in public domain and that no output from a non-human generative software be considered for human ownership. I also strongly opposed the idea that generative AI, which is largely enhancements to auto-complete algorithms and image upscaler, be properly separated in verbiage from machine learning used for medicine and from proper attempts to create AGI (Artificial General Intelligence) which is an entirely different field of research and does not rely on cloning and polluting existing human works and information.

Thank you for your time!  
Scott Fronapfel
