ServiceNow's Response to the Request for Information on the Development of an Artificial Intelligence (AI) Action Plan

ServiceNow commends the White House Office of Science and Technology Policy (OSTP) and the Networking and Information Technology Research and Development (NITRD) National Coordination Office (NCO) for seeking public input on the development of an Artificial Intelligence (AI) Action Plan, and is grateful for this opportunity to respond.

ServiceNow the AI platform for business and government transformation. The AI-first ServiceNow Platform acts as a unifier on top of legacy systems and outdated tech stacks to simplify complexity and activate workflows across disparate departments. Spanning two decades and trillions of workflow executions, ServiceNow's scaled capabilities have a proven track record of driving cost efficiencies and increasing productivity for large public and private sector organizations. As an American company with over 26,000 employees globally, ServiceNow supports over 85% of Fortune 500 companies and hundreds of federal, state, and local government agencies.

ServiceNow is committed to providing the American workforce with in-demand job skills. We have a goal of educating 3 million learners on our platform globally by 2027. By offering 600 free courses and 18 job-related certification paths, we allow individuals to work at their own pace. Already, more than 1 million individuals have completed 6.7 million courses, paths, in-person, and virtual instructor events globally since 2022. We've also provided training to hundreds of transitioning service members through participation in the DOD SkillBridge program.

As a leading American AI enterprise workflow company, ServiceNow recognizes the transformative potential of AI in enhancing government efficiency, economic growth, and national security. We appreciate the opportunity to contribute our perspective to the Administration on priority policy actions to sustain and enhance America's AI leadership, and respectfully submit the following recommendations for consideration.

1. Strengthening Existing Risk Management Frameworks

Consistent with Executive Order 13960 issued during the first Trump Administration, which supported voluntary consensus standards, rather than create new, burdensome requirements, the Administration can task the National Institute of Standards and Technology (NIST) to build upon the NIST Risk Management Framework (RMF), which is voluntary and solutions oriented. Additions to the RMF can include clear standards for testing, evaluation, security, and documentation. Promulgating these voluntary—rather than compulsory—standards will accelerate AI innovation, adoption, and collaboration, remove uncertainty and friction that currently holds the market back, and promote America's global leadership by providing a workable, American-led alternative to harsh regulatory regimes.

2. Supporting Open-Source Solutions

Open-source software fosters transparency, collaboration, and rapid innovation. Encouraging the use of open-source AI solutions allows government agencies to customize tools to their specific needs while maintaining control over sensitive data. This strategy can enhance security, reduce costs, and promote cross-agency collaboration, ultimately leading to more efficient and effective government operations. The Administration can avoid harsh over-regulation of open-source models that holds back innovation and progress in this area.

3. Fostering Public-Private Partnerships

Innovation thrives in environments that support experimentation and agility without the constraints of regulatory uncertainty. We appreciate that the Administration has made it a priority to work with industry experts in policy formation to ensure that regulations reflect practical insights and promote innovation over overburdensome regulation. We encourage this work to continue.

4. Promoting American AI Leadership Globally

Active participation in international discussions on AI standards, led by industry and supported by government partners, is crucial to maintaining America's leadership in the field. Engaging in global efforts to establish industry-driven standards, supported by government initiatives, fosters a strong domestic framework and strengthens American competitiveness. This proactive stance prevents adversaries from defining the AI landscape and ensures that U.S. values are represented in global standards.

5. Investing in Talent Development

Addressing skills shortages will be imperative for sustaining AI innovation. Investing in STEM education, upskilling, and reskilling initiatives will ensure that the American workforce remains competitive in an AI-enabled world. Given the rapid evolution of AI technologies, a significant portion of workers will require training to adapt to new roles and opportunities. In particular, the Administration can support AI and STEM education through Career and Technical Education (CTE) programs, as well as DOD training and education activities, authorities, and partnerships.

ServiceNow is committed to supporting the development and implementation of an AI Action Plan that fosters innovation and enhances government efficiency. By building upon existing voluntary frameworks, promoting open-source solutions, empowering industry leaders, engaging in global standard-setting, and investing in talent development, the United States can maintain our leadership in AI and deliver tangible benefits to our citizens.

We appreciate the opportunity to provide input on this critical initiative and look forward to continued collaboration with this Administration, the OSTP, NITRD, and other stakeholders in advancing America's AI capabilities.

Respectfully,

Combiz Abdolrahimi
Vice President
Global Head of Government Affairs and Public Policy
