

Shrian Dudy

To whom it may concern, As an AI researcher in academia, I propose the following advice: The US can be a leader in Participatory AI (PAI) which is what you are doing now. PAI is all about soliciting feedback from experts/public on how to shape AI and have a continuous engagement with your constituents. What you do here is the first step towards having that conversation. AI is a living thing which may not be a one-size fits all. So the next time you ask for input can be on several subcategories of AI such as AI and Education, AI and Healthcare etc. Continuous engagement is important since what we think will make the US a leader in AI today may not be relevant tomorrow when another DeepSeek-like concept is released. Po.lis is a tool Taiwan is using to listen and address needs of its people. It reflect to us what we "the people" think and help us gather up around shared ideas. Beyond putting the US in the front through comments like this, PAI will demonstrate a strong governmental leadership that is fostering a conversation with its people. This in turn will increase America's soft power, the one the draws talented people here as finally we can find the things on which we agree with each other and get a greater consensus on decisions made by the government. Best, Shiran Dudy
