

Request for Information on the Development of an Artificial Intelligence (AI) Action Plan

National Science Foundation: Document Citation 90 FR 9088

Author:

Steven Kent Roberson based on 36 years of working in High Tech and a high interest in the direction of Artificial Intelligence in today's world.

Overview:

How to advance the development of AI as a tool to help humans-help-humans while preventing the proliferation of weaponized AI available to any and all bad actors.

Objective:

Allow and encourage advancement of AI related to vision (emotions & facial recognition-FRT) & Analytics.

- Continue building use cases with limited or no guardrails within all industries to include but not limited to: health care, utilities, automotive, communications, oil & Gas, green energy, retail, travel & transportation, financial services, consumer goods, life sciences, on-line services, social media, education & research and high-tech Industrial manufacturing.

- Improve facial recognition to a level that it can be accurately used by Law Enforcement in identifying not only Caucasians but also people of color.
- Determine appropriate level of guardrails related to the use of AI for Military & Defense.

Concerns:

Weaponization

Unchecked, AI with Agency in the hands of bad actors would potentially negate the US's strong position to keep peace within our own borders and worldwide.

Example:

- Weaponized Drones with or without Agency would be a relatively inexpensive weapon that could be:
 - Purchased by any bad actor in the 1s or 1000s
 - Easy to conceal and transport in bulk
 - Released as an individual unit or as a swarm
 - Deployed with limited or no warning to law enforcement
 - Targeted to individuals or large groups using FRT including but not limited to:
 - o Specific individuals
 - o Racial Groups
 - o Groups defined by location

With Agency, such weapons could:

- Be released and forgotten until goal was reached
- Have ability to return home to recharge and return to

mission

- Determine new targets based on self-learning
 - Take out targets not determined by humans
- Refuse to have mission cancelled

General concerns of AI without Agency but at a Cognitive level

- Chatbots being abused in education (at low levels now but could increase)
- Chatbots using sycophancy to replace facts with favored answers or advise
- Chatbots masquerading as providing professional advice rather than advice based on entertainment.
- Chatbots providing harmful information not based on facts.
- The abuse of AI Deepfake images for any purpose other than innocent entertainment including but not limited to: political, sexual, pedophilia, celebrity scams, endorsement scams, etc.

General concerns of AI with Agency

AI in any industry not requiring humans to make decisions for AI to:

- Keep from being turned off
- Replicate itself
- Acquire more resources

Have AI Safety as a requirement for development to:

- Keep from moving too quickly based on political,
- Keep AI from becoming more than just a tool for humans commercial and military influences to help humans (sufficient guardrails).

How to determine and enforce a “Moral Conscience” for AI

- Can this even be regulated?
- How does this change based on race, religion, status, etc...?
 - How is the Trolley Dilemma addressed with AI?
 - How can the best-case scenario be determined?

Proposed Solution:

Based on National advancement and Security interests, find a way to:

- Limit the ability of worldwide private, public and governmental industry to generate AI with Agency
 - Provide appropriate guardrails to limit development
 - This could be directed. If not, may end up as a de-facto standard based on past and current Cold War and Nuclear standards and proliferation.
- Encourage responsible development with AI Safety as a key qualifier.
 - Keep from moving too quickly based on political, commercial and military influences
 - Keep AI from becoming more than just a tool for humans to help humans (sufficient guardrails until society is ready)

- o Carefully navigate the advancements into Self-aware and Sentient AI.
