As someone who is both in tech as a software developer and also a hobby artist, I have a unique perspective on "both" sides of this issue and I have to say this would be a bad idea. There are a few reasons:

1. It sets precedent to undermine all of copyright, hurting not just the arts, but also businesses in every industry.
2. AI's biggest value is use cases that require niche training. This includes: detecting cancer in X-rays automatically, enhanced photo cleanup tools, facial recognition, assisted/more accurate motion detection, robotics, etc. in all of these use cases, unauthorized copyrighted training data actually provides little to no value. Broad datasets are not beneficial. They all require limited datasets to be useful. "GenAI" - the type that has tech execs begging for this executive order - has limited function in any true money making capacity nor in improving our scientific posture on the world stage. It will not benefit the US in any way. This is a risk with no reward.
3. There are huge negatives already to GenAI. It's already *plenty* accurate at generating images and videos such that it genuinely causes confusion and risks absolute chaos as what is true becomes questionable. I'm sure the administration would love more of that but hey you already have it. It's already doing this quite well and it's constantly improving without copyrighted works.

I think regardless of what aisle of the political spectrum you sit, dismantling copyright here would very negatively affect small and large businesses alike with nothing gained.

Thank you for reading and your time.
