Hello,

It is my understanding that AI models compress training data down to a matrix that they then use to generate responses. Those responses, for some queries and some training data, may reproduce the contents of the training data.

This is not ok. This is a clear violation of copyright law. You are not allowed to make a thing that has a chance -- any chance -- of intentionally reproducing someone else's copyrighted work.

Should you doubt the validity of my claims, I would ask you to investigate OpenAI's implementation of a secondary layer on ChatGPT that checks to see if their AI model is dumping large quantities of copyrighted text to the user and stops the response mid-way if it detects said copyrighted text. This suggests to me that modern AI models do, in fact, have the ability (and the propensity!) to distribute copyrighted work.

It is my belief that the government should strongly investigate one or both of the following stances: AI models should be treated as compressed data, and that all of their training data should be considered to be in their data, and/or all AI-generated data should immediately enter the public domain.

AI is directly responsible for a loss of American jobs, American productivity, and in a handful of cases, American lives. It is astoundingly good at generating things that *look* correct but aren't. We do not need to protect American AI interests. We should instead be looking to protect American intellectual work and prohibit the use of AI for tasks where it purports to present factual information.

If you have any questions, please do not hesitate to get in touch.

Tony Zigelman
