This is my proposal with a rough sketch.

Create Department of AI Innovation, which may have three divisions:

- A. Physics and Chemistry area,
- B. Biotechnology and Medicine area, and
- C. Social and Mental area.

Of course, each division or segment cannot be strictly separated because they overlap each other. Director and Assistant directors may be needed to determine what will be handled in each division of the department.

By using AI power, possibilities will be enormous and beneficial to people, the participating companies, and the country, and humans.

I roughly describe a few ideas using AI powers in the following.

A.

Ex. 1.

The current air-conditioning unit uses the old thermodynamic principle through pumping refrigerant through the system. Although the solid-state chip using Peltier effect is available, it's not efficient for large scale air-conditioning system. Rather than using thermodynamic system, nor Peltier effect, spin reduction of temperature is possible in the future. Find out new elements or materials for solid-state air-conditioning, by use of spin reduction of temperature. We can use AI to find out most effective materials.

Ex. 2.

Developing Smart Agriculture system will bring innovation to agriculture. If robots can be utilized to seed the plants and crop identifying fruits and vegetables, we can eliminate illegal immigrants that are exploited to work in agriculture industries. Furthermore, when such smart agriculture system is developed, it can be used in the moon base or Mars base, or in the space station in the future. Experimental laboratories may be set up in the cruise ships to provide fresh vegetables and fruits through a container producing vegetables and fruits.

If remote manipulator robots with AI assisted are developed and utilized, even people with disabilities, who are in a few percent of population, can work remotely to help nurses in the hospitals. This will make DEI-advocates be persuaded; they are not excluded from the work force.

Ex. 3.

AI can be utilized to increase Solar panel efficiency by the surface treatment, trapping light energy, and / or new materials. If new ideas can be found, obtain patents as a governmental IP, and disclose them to the interested companies with fund.

Ex. 4.

Increase geothermal plant efficiency.

Ex. 5.

I myself have a theory for AGAF (Artificially generating acceleration field). But I don't know yet how I can make EM resonation field. If AI can be used to visualize EM field, I may find magnetic resonance to realization of AGAF.

B.

Ex. 6.

In order to reduce the future health cost in both insurance and nursing home burden, it is vital that we develop the way to extend human health span. The knowledge and biotechnologies are now ready, ironically thanks to COVID pandemic. Based on such books as 'Lifespan by David Sinclair' or 'Telomerase Revolution by Michael Fossel', telomeres (TTAGGG in mammals) at the both ends of DNA shortens in each cell division because DNA polymerase cannot hold the end for duplication. Telomere length about 15000 at birth becomes shorter and shorter and cells become senescent at about 6000 in order not to harm genes; the increase of such cells gradually decreases cellular functions, thereby bringing about malfunctions of organs, may eventually result in age-related diseases, such as atherosclerosis, dementia, heart attack, strokes, etc. Human lifespan is limited about 120years (Hayflick limit), which means $6000/120 = \text{about } 50$ telomere loss per year. Children with "progeria" dye of what looks like old age. Therefore, re-lengthening by use of mRNA, coded with hTERT and hTERC, injection will re-length to the original length, rejuvenating cellular functions. A conference is needed for safer procedure and assessment of such procedures through AI evaluation on interactions. Such treatment may be used to treat damage caused by radiation, too. Moreover, removal of senescent cells by use of modified T-cells may be included in the treatment to make us much healthier. Without indefinite extension of health span, humans cannot go beyond the solar system.

Ex. 7.

Analyze the biochemical pathways in the body completely. Provide health monitoring system for people for the better practice in maintaining health through nutrition and exercise.

Ex. 8.

Diagnosis system of AI doctor. Suppose we have a rash on our skins which we don't know what has caused such a rash, nor can how we heal it. If we take a picture of a rash, AI doctor analyzes the picture and give us a diagnosis, giving us a medicine or how to heal it. Such AI diagnosis system may eliminate high cost of hospitals' treatment.

C.

Ex. 9.

Enhancement in learning for language or knowledge of established skills by use of meditative

state or hypnotic learning. AI analysis is much needed in this field. Also good will must be employed; otherwise, the method might be used for brain washing in jihads' countries.

Ex. 10.

Social interaction can be analyzed by use of AI.

In summary, each division works as a command center for research and development of ideas by use of AI power as much as possible. Obtain patents and hold as an IP of the government. From time to time, a conference is held by inviting companies and ventures which want to participate in the development of ideas to bring about the products. A governmental IP is shown to the participants and allocate necessary fund to let them pursuit a profit. Through company-like activities, government obtains profit which may be used for payment to, for instance, social security benefit, or create funds in Treasury, thereby reducing over-all Tax on low-income people.

To avoid conflict of interests, the profit may be allocated by a rule: for instance, individuals : companies = 50% : 50%. Because some law suits in the past show that individuals argue in the profit that the company gains. Individuals create original ideas and pursue by use of company equipment, but without endeavor that individuals make, the company cannot make a profit. On the other, individuals were unable to further pursue ideas without using company's equipment or facilities. It should be set up some rules on the profit by use of ideas originated in individuals and the use of tools and equipment provided by the company to avoid conflict in the future so that they both may be rewarded, avoiding unnecessary conflicts.

Sincerely,
T. Tide
