Re: AI Action Plan (*Networking and Information Technology Research and Development (NITRD)
National Coordination Office (NCO), National Science Foundation*)

Mr. D'Souza,

[Truepic](#) would like to thank the National Coordination Office and the White House Office of Science and Technology Policy for providing the opportunity to respond to this RFI. Truepic is a digital verification company empowering businesses and industries to drive digital transformation through secure and authenticated imagery. We believe that image and data verification unlock tremendous efficiency in industry and government. We are grateful for the opportunity to share this information with your offices.

Today, Truepic's technologies serve as foundational components in the digital strategies of the world's largest financial institutions, insurers, and enterprises. By providing cryptographically assured, verifiable images and data, we enable organizations to make faster, more confident decisions while reducing reliance on costly and time-consuming manual verification processes. This breakthrough represents a significant opportunity for innovation in the AI era and serves as a method to help reduce fraud in business, government, and with consumers through enhanced authentication.

How it Works

For the past decade, Truepic's team has been at the forefront of digital image authenticity and data verification, empowering organizations to operate with confidence in the integrity of the digital content that informs their decisions. We achieve this by embedding authentication technology into the workflows of the world's leading financial institutions, insurers, and businesses.

Truepic's flagship product, [Vision](#), enables organizations to collect authenticated images and data directly from customers, field agents, or other stakeholders using any smartphone. The technology verifies the authenticity and provenance of each image at the point of capture, ensuring it has not been manipulated, edited, or artificially generated.

When an image is captured, Truepic Vision embeds [cryptographic seals](#) (aligning to interoperable global standards) and verifies metadata, including timestamps, geolocation, and device information, to establish a verified chain of custody. These verified images and data points seamlessly integrate into existing underwriting, claims, and risk assessment workflows, reducing fraud, accelerating decision-making, and eliminating costly in-person inspections. By providing instant verification in digital content, Truepic Vision enables financial institutions, insurers, and businesses to streamline operations while ensuring the highest standards of authenticity and security.

This approach is driving tremendous efficiencies, expanding opportunities while also reducing fraud and mitigating bad actors. We believe the OSTP team should consider how image and data authentication can increase efficiency, reduce bottlenecks, drive opportunities, and better protect businesses and consumers today.

Case Studies: Driving Efficiency

One key area where image authenticity and data verification are driving efficiency is in [modernizing business credentialing](#). Traditionally, certifying the existence of an asset or

business has relied on manual inspections and documentation reviews, which can be both costly and time-intensive, delaying operations and business growth. The ability to verify images and data at the point of capture, with cryptographic authentication, is fundamentally changing this process. For example, in the case of business verification, digital image and data authentication has helped reduce **processing times by 11 days**, allowing businesses to be onboarded faster, reducing administrative burdens, and getting borrowers up and running faster. This shift unlocks broader economic growth and innovation.

Another industry experiencing efficiency and innovation through verified digital inspections is the warranty industry. In [auto warranty](#), fraudulent claims and unverifiable documentation contribute to delays and significant fraud. Image authenticity tools prevented warranty providers from paying an additional **10% of claims** by flagging them as potentially fraudulent, while cutting the time required to review claims by **66%**. This has enabled companies to expedite decision-making, improve customer experiences, and allocate resources more effectively.

Similar efficiency improvements can and should be applied to government workflows, where authenticated digital documentation could enhance verification processes for licensing, permitting, and compliance monitoring, ultimately reducing delays and administrative overhead.

Role of Standards

Truepic ensures its digital verification platform aligns with and complies with emerging digital content provenance standards developed by the [Coalition for Content Provenance and Authenticity \(C2PA\)](#). These standards provide a universal framework for verifying the origin, integrity, and authenticity of digital content, helping to establish trust in an increasingly AI-driven and digital-first world.

By adhering to C2PA standards, Truepic ensures that images and data captured through its platform maintain a chain of custody, cryptographically proving their authenticity from the moment of capture. This approach not only strengthens the security and reliability of digital workflows but also enables interoperability across industries and regulatory environments, a critical benefit for enterprises.

Standardized provenance frameworks are essential for scaling digital verification across financial services, insurance, government, and other sectors that rely on authenticated content for critical decision-making. As policymakers and industry leaders work to develop regulations and best practices for content authentication, Truepic remains committed to contributing to and supporting these efforts, ensuring that verification technologies uphold transparency, security, and trust at a global scale.

Recommendations

Drive Efficiency: Federal agencies should adopt and incentivize authenticated digital verification to eliminate bottlenecks and reduce operational costs. Many government functions still rely on in-person oversight, audits, and inspections—whether for State Department and Department of Defense assistance programs, Customs and Border Protection (CBP) monitoring, Disaster Response, or Fannie Mae and Freddie Mac compliance reviews. By adopting and incentivizing secure digital verification technologies, the U.S. government can enhance efficiency, reduce administrative costs, and accelerate decision-making across critical sectors. This shift not only drives significant savings but also fosters a more agile and responsive regulatory environment, benefiting both government operations and the industries they support.

Consumer & Business Protection: Consumer protection can be significantly enhanced through image and data authentication backed by interoperable standards like C2PA. This technology helps ensure consumers interact with trustworthy digital content across e-commerce, real estate, and online marketplaces by preventing fraudulent listings, manipulated images, and misleading claims. Verified images can safeguard buyers from deceptive advertising, protect renters from misrepresented properties, and ensure transparency in auto sales and warranties. By integrating authentication standards into consumer protection frameworks, businesses and regulators can reduce fraud, enhance trust, and create a more secure digital marketplace.

Similarly for businesses operating in digital environments, this approach is critical to protect processes and operations in the AI era. To mitigate risks of deceptive digital content, businesses must adopt authentication and verification measures that verify the integrity of digital assets, ensuring that AI-generated content is distinguishable from authentic media. Implementing such

measures at scale can help enterprises prevent supply chain fraud, protect CISA-designated critical sectors, and maintain compliance with evolving regulations. As AI-driven threats continue to challenge digital ecosystems, embracing standards like C2PA will be crucial for fostering a secure, transparent, and trustworthy online environment.

Conclusion

The impact of image authenticity and data verification goes beyond simply making processes faster—it ensures that digital content can be usable and operational at scale. In an era where manipulated media, AI, and unverified documentation present challenges across industries, establishing authenticity at the point of capture strengthens decision-making for businesses, governments, and consumers alike. By embedding verification mechanisms into digital workflows, American business, government, and society will be prepared to thrive in the AI era.

We look forward to continuing this conversation and are happy to provide further details and collaborate with the OSTP and its affiliated agencies on these critical issues.

Best regards,

Mounir Ibrahim
Chief Communications Officer & Head of Public Affairs
