Veronica Garcia, [REDACTED]

I am Veronica Garcia, a senior at Avonworth High School in Pittsburgh, Pennsylvania. I studied generative AI and its impact in the classroom, specifically in English as a Second Language education for two months in a course on AI and Ethics this year. I believe this administration's viewpoint on A.I. is too liberal in its deregulation. I believe an emerging industry must be carefully monitored while not stifling innovation. This delicate balance is possible, though, the administration's attitude towards the AI industry indicates this balance cannot be reached. The complete deregulation of the emerging industry in hopes of inspiring innovation is completely reckless. Regulation is necessary for nurturing an industry in its infancy. Complete deregulation risks fostering malevolence, misuse of this new technology, and emerging monopolies. Additionally, student's ability to freely access AI is alarming. Generative AI, specifically, is most prominent in schools. Generative AI is not inspiring innovative thinkers and productivity in our students but rather teaching students to over-rely on this powerful technology. This in turn is hindering student's intellectual capabilities and development. Student's freely accessing generative AI is detrimental to the future of our country. This administration has to work to address these concerns for their future implications.
