The Impact of Artificial Intelligence within the Creative Community and Entertainment

Section I: Workforce

Artificial Intelligence and the precedent that it sets has monumentally impacted the current and future state of the entertainment industry's workforce. Within the last 3 years, the American entertainment sector has lost thousands of jobs, displacing professionals across the television, film, animation, VFX and video game sectors. Within 2024, the elimination of 15,000 jobs has thrust the entertainment industry as well as its professionals into a severe position of economic uncertainty.

Professionals have vocalized that their circumstances have become vague not only because of the current status of their household economics from losing their primary source of income, but in tandem with the emerging situation that job growth within this industrial sector has either stagnated or disappeared entirely. In short, after professionals have lost their jobs, there is no recourse for them being able to definitively attain work within their chosen sector or with regard to their previous income and lifestyle dependency on said income, because the industry has frozen in its prospects of taking on any potential workforce.

This is as a result of the precedent Artificial Intelligence has set within the strategic decision making of leaders within the entertainment industry. It has posited within their understanding that the work of specialized professionals, those so ingrained in the skills required of their fields that their placement within other sectors is limited, can be substituted with the fantastical prospects that AI promises and promotes. It is because of this that job growth and the opportunities for these specialized working professionals will dwindle into non-existence. As workforces are slashed down to populations of a mere few, either out of spite to unionized forces, cost cutting measures, or hyper profitability models, every tactic will be played to reduce profitable, stable, dependable, livelihood-supportive work for creative professionals within any section of the entertainment industry.

Artificial Intelligence furthermore sets a greater precedent for the participation of the entertainment workforce within their desired career spaces, day to day operational responsibilities and their ability to adequately perform in the specifics of their roles. Artists and creatives undergo a period of training, be it personal, institutional, lifelong, apprentice or mentor based. It is through this period of training that they gain the necessary skills to adequately perform within professional spaces and to be utilized as a labor asset to the production of entertainment production, whatever that may take the form of. It is this training period, however long and that bodes whatever results, that has them directly build a basis of knowledge, accuracy, skill and craftsmanship. One that utilizes their unique perspective, impression and abilities to issue forth valuable results that businesses utilize for production and subsequent profits from that production.

Artists were trained to perform in their raw ability, with results only transformed by the abilities of additional human creative input. Artists were not trained, nor encouraged, nor took on lengthy periods of training, to utilize AI as a component, crutch or substitute to the creative process. There are many artists who have taken on this professional and career-long pursuit to directly participate in the action of creative conception, solely by merit of their human input, untainted by the generated product of Artificial Intelligence. Human art making is an forwarded impression of human intelligence, moment to moment decision making, perspective, diligence and dedication. It is the right of the human to determine how they are to conduct said pursuit and it is unquestionably justifiable for them to deny the request of an institution, business entity, manager, executive or otherwise to incentivise them to utilize AI as a component to the process of art making.

Artists, over the course of human history, are fundamentally hired by their skill and the product that skill is able to realize. For an artist to be forced as a business tactic to utilize a technology that does not express their individual skill not only diminishes their importance within this field, and discounts the value of their labor, but also diminishes their value within the available professional market altogether. It is the starting and perceived continual discounting of this labor force that will decline the value of the business' product, revoke the prospect of proper compensation, create unfair working conditions, incentivise a system of intimidation by those in power, dissolve the mental fortitude of laborers and eventually destroy this industry from the inside out.

AI cannot be adopted into pipeline processes and forced into the hands of creatives as a means of producing any form of work within the entertainment industry.

Section II: Intellectual Property

Artificial Intelligence was trained on the foundation of intellectual property. There is no open form of documentation to concretely present forth the argument that this was not the case. Regardless of the ethical implications and sourcing of this mass collection of data from across the world, any usage of AI to produce anything calls into question what exactly the source material can be verified as, who produced it, what conditions it was created under and who officially created it. AI's muddled water of connecting produced material to its sources issues an impossible task, one that even its creators would not be able to decipher or undertake.

It is with this in mind that we call into question the ownership of Artificially Generated materials, be they visual, video, writing or otherwise. We are well aware of the concept of creative ownership. We are well aware within the entertainment industry of artistic consensual releases or the integration of Intellectual Property to be used within a production space with consent given by the current owners of said property. Artificial Intelligence does not only complicate the process of displaying true ownership of that which it generates, but it blurs the lines when considering its integration within the legalese of production spaces, the ownership of profit off of works that include it, the rights to which owners hold can distribute or can adapt said works and much more ambiguous notions.

If AI has been trained off of the works of all of humanity, its boundaries non-existent in public disclosure or understanding, than it is logical to posit that any artist whose work has been used to train an AI model can claim ownership over any work that utilizes the generated material from said model. Or that the work that stems from an AI model, be it a foundation for later change or its immediate integration into a production, is owned by the AI model and its creators itself.

It is an impossible nightmare to sift through the logical assertions to which ownership of any intellectual property is to be understood when adapting AI into any circumstances. Prior to AI there were truly real outlined barriers of events and individuals and action that could be properly assigned to various forms of documentation, contractual obligation, releases, legal ownership and profitability.

The adaptation of AI into any large scale professional production sets the notion that at any point, any AI company, leader, etc, can procure and determine ownership of any work produced by or with generated materials. By extension, any measures to skim profit from business entities within entertainment and funnel it into the accounts of AI companies revokes profitability from the industry itself, removes the ability for works to be independently produced in the future, sets forward a greater potential for investor power instead of agency by the business itself, and further removes opportunity from the field.

The stipulations of ownership and profitability must be definitively outlined within smaller scale agreements and broader legislation to properly define the procedures to which ownership is conducted and legally solidified from one party to another.

Section III: Economics

Entertainment in the current era of media has never before been such a consistent part of human being's day to day lives. Its visibility is immeasurable and the profits of successful works has never before been more attainable at all levels. However, the integration of AI will destroy the current state of profitability for entertainment into the foreseeable future.

Human beings over the course of human history have created works solely by vocalizing, delivering and transforming their perspectives within an accessibly digestible format. Be it through the usage of any medium, this practice has occurred throughout human consciousness and has been seen as a pure form of expression and as a means of sharing depthful information throughout time. Human beings are each individual, with their own perspectives, minds, reactions, stances, memories and experiences. Each stimulus ingrained in their being from the moment they start understanding the world around them, one that creates who they are throughout their life. It is through the creation of artwork that we outwardly share these traits with one another. It is through the consumption of these works that we adopt new experiences, curate new memories, learn more from ourselves and others, and progressively share in a collective consciousness. That is not a practice that can be overtaken by the generation of material produced by Artificial Intelligence. It is the direct conversation of one human being to another. That is invaluable. It will forever exist.

The adoption of AI within creative spaces and the production of artistic material is a futile attempt to pull the focus of the masses to a novel piece of technology. That they may have their fun playing with the possibility of realizing anything onto a screen. But in the economics of creative business, this is essentially useless. It is not the existence of a work itself that derives the possibility of profit, but the value that the product creates alongside the desire of its consumer base to purchase it. Within entertainment, it is the divulgence of human expression that is the core facet of why humans consume this particular product.

Human beings do not enjoy being lied to. They do not enjoy falsity. Although they may be temporarily enraptured by false promises and façades they will eventually grow bored of entertainment that does not speak directly to them. Entertainment that captures their attention, posits new ideas never before considered and leaves them hungry for another installment. AI cannot produce work that resonates with audiences on a fundamentally core level, because AI does not possess the unique experiences that a human being would, and AI cannot adapt its own

experiences into digestible artwork. AI does not have a story to tell and does not have one that can be sold either.

The entertainment industry in 2024 brought in \$1 Trillion dollars of value, and it could bring about even larger profits if more works were produced by larger populations of utilized talented professionals working in conditions that directly promote the quality of their output, creating even more opportunities for profitability growth from any type of production or business entity. AI disrupts this potential and the entertainment industry, with its leaders attempting to sell its consumer base a product that they will never gain effective ownership over that holds no real value. The general GDP of the United States of America could be even greater if it would utilize the resources and assets that it currently has at its disposal within the workforce of the entertainment industry instead of diminishing their value and overtaking their responsibilities with a valueless substitution.

Human made art will prevail amongst humanity. It is one of the most impactful actions any human being can participate in. AI would not exist if it did not steal and utilize whatever power still existed from the source material even when degraded and stripped for its parts. Independent entertainment will continue to rise as artists take back their agency in production. They will deny the inclusion of AI into their practices. Artists, unsurprisingly, want to actually *make* art.

All this period serves to do is redirect attention and falsely promote AI as an otherworldly power, to propose that it could ever possibly do the work of a human, an idea that humans clutch on to with controversy and conversation, ones that are an asset to public recognition and profit. AI has disrupted the greater entertainment industry. It has removed power from artists within professional spaces. It has cast away their financial security, destroyed their career prospects and pushed them into dire circumstances. It will take a lot of passionate individuals to rebuild this industry to what it once was. But for as long as human beings exist, they will have the desire to create, be it beautiful works that inspire the masses and create greater connection with one another, or destructive technological systems that revoke our rights, rape the product of our labor and call us worthless in turn.

Legislation must be passed and the procedures of the entertainment industry must be distinctively weighed and outlined for a sustainable practice into the future, including AI or not. Or else one of the last industries of the United States unaffected by tariffs and produced solely through labor, will cease to exist and further contribute to the downfall of America's economic state.
