Objections to Unethical Data Scraping by Tech Conglomerates

I hope this message finds you well:

As a citizen of the United States, I object to plans to make permissible the exploitation of all available user data in the name of empowering a tech industry that is already running unchecked. This move runs counter not only to common sense, but the manner in which the layman has been forced to operate for years. This would undermine creative industries that provide immense value to the daily lives of people across the globe; an industry currently being exploited for the benefit of these very same executives. This technology has the potential to undercut creative contractors from all walks of life, not on the basis of providing a comparable service or skill, but on the basis of being able to provide an output faster than any person (due to the generative models averaging real work done by real people). The technology does not have the ability to democratize art or creative endeavors as their respective companies would like you to believe. This is partly due to creative pursuits already being democratic by nature; anyone can participate at any level with any available materials. It is also due to the much more pressing issue of the generative artificial intelligence industry being a house of cards poised to topple at

the expense of the common man and what dwindling goodwill the United States government has left. This motion would be a grave mistake and a far cry from actions that seek to “promote human flourishing, economic competitiveness, and national security”. As governments look to the United States for how they will deal with legislation regarding generative artificial intelligence moving forward, it is imperative that these decisions be made with the people in mind and not the tech oligarchs.
