1.0 INTRODUCTION

We appreciate the opportunity to respond to the National Science Foundation’s Request for Information (RFI) on the National AI Action Plan. Our response advocates for Workforce AI™ as the only non-complicated solution for AI-driven workforce augmentation in the federal government. Workforce AI is a human-centric artificial intelligence platform purpose-built to empower employees - augmenting, automating, and ultimately replacing repetitive administrative tasks. By emphasizing an intuitive human-user interface, ease of use, and seamless integration into daily workflows, Workforce AI can drive rapid adoption, boost efficiency, and enhance institutional knowledge across the federal workforce.

Workforce AI is a human-centric artificial intelligence platform purpose-built to empower employees - augmenting, automating, and ultimately replacing repetitive administrative tasks.

In an era when U.S. global leadership in artificial intelligence is pivotal to economic competitiveness and national security, Workforce AI offers a groundbreaking solution to transform federal operations. Our digital employee platform is engineered to augment human capabilities by automating repetitive tasks while preserving the essential human touch, thus ensuring that government efficiency is not only improved but also aligned with the broader strategic goals of maintaining American innovation and leadership in AI. By delivering rapid, measurable productivity gains at a fraction of traditional costs, Workforce AI stands as a key enabler for a modern, agile federal workforce that drives the nation’s competitive edge.

Unlike traditional chatbots (which are primarily text-based, requiring specialized “prompt engineering”) or complicated enterprise AI platforms, Workforce AI ensures a frictionless experience. We deliver a simple AI with personality - an accessible video avatar which looks like a human that employees readily trust, rather than a purely text-based black box. This difference is crucial: many AI deployments fail after pilot phase because employees find them too cumbersome or non-intuitive. Workforce AI breaks through this barrier, allowing agencies to finally collaborate with an easy-to-use AI that fosters genuine day-to-day adoption.

We focus on “simple AI” with personality, ensuring a real sense of collaboration. Our approach fosters easy user interactions that let employees feel they are working side-by-side with a digital colleague, rather than commanding a black-box system.

In light of Executive Orders 14158 & 14210, and other related DOGE initiatives that mandate aggressive modernization and efficiency improvements (including hiring ratios that limit new hires to one per four separations), the federal government must modernize quickly. Workforce AI’s digital employees are designed to deliver rapid, measurable wins that support each agency’s mission while fulfilling policy mandates. Our solution reduces the cost burden by delivering humanlike AI-powered digital employees at approximately 20% of the cost compared to typical a federal administrative employee. We can provide significant budgetary relief while also boosting workforce productivity and enhancing institutional knowledge through task augmentation.

We offer bold, evidence-backed insights below on how Workforce AI can help achieve the AI Action Plan’s goals, along with policy recommendations that leverage these strengths. We conclude with a call to action to ensure the federal government fully realizes the benefits of our approach.

The sections below demonstrate how Workforce AI's unique approach, alignment with federal mandates, and robust security posture can be a game-changer for federal operations.

2.0 CAPABILITY STATEMENT

2.1 What We Do

Our solution augments, then automates, and finally replaces repetitive administrative tasks by deploying human-like digital employees into online meetings, websites, applications and daily workflows.

Through our Human User Interface (HUI)[™], digital employees engage in natural, conversational interactions with federal staff, thereby increasing their knowledge, and enabling smarter decision-making. The digital employees can also perform tasks for federal workers. AI performing tasks is known as agentic activity.

Through our Human User Interface (HUI)[™], digital employees engage in natural, conversational interactions with federal staff, thereby increasing their knowledge, and enabling smarter decision-making.

2.2 How We're Different

- ✓ **Human-Centric Design:** Unlike traditional AI or rigid automation platforms, our realistic video avatars foster trust and ease-of-use among non-technical users. Think of each digital employee as a 'digital twin' for each worker – capable of mirroring tasks, capturing knowledge, and offloading routine processes so the real employee can focus on critical problem-solving.
- ✓ **Seamless Integration & Scalability:** Our system can integrate effortlessly with existing government systems (e.g., ERP, CRM, MS Office, Teams) and supports rapid deployment and scaling which is essential under the current federal modernization mandates. These integrations will minimize disruption to existing workflows.
- ✓ **Cost Efficiency:** By replacing tasks that cost an average of \$50K per employee annually with digital employees at approximately 20% of the cost, agencies can achieve significant cost reductions while maintaining productivity. digital employees at approximately 20% of the cost, agencies can achieve significant cost reductions while maintaining productivity. For example, replacing 10,000 administrative roles at \$50K each saves \$500M annually, while deploying 100 digital employees would cost approximately \$100M, yielding \$400M in net savings per year, or a 75% cost reduction, enhancing budget flexibility for mission-critical initiatives.
- ✓ **Faster Than Hiring:** While it can take agencies months to recruit, vet, and onboard new employees, deploying a digital employee often takes just days. This drastically cuts the time-to-productivity gap. Rather than waiting 3–6 months for new staff, agencies can spin up Workforce AI's digital workers nearly immediately - enhancing capacity and output long before a human hire could be found.
- ✓ **Security & Compliance:** Our proactive approach will include regular third-party audits to align with FedRAMP, NIST 800-53 and AI RMF frameworks. We ensure that all data is encrypted in transit and at rest, meeting federal security standards essential for immediate pilot deployment.

- ✓ **Design Philosophy and Ethical Considerations:** Our design philosophy is rooted in the principle that AI must be accessible and understandable to truly empower federal employees. By also emphasizing a transparent, human-in-the-loop model, Workforce AI inherently reduces the risk of opaque decision-making, minimizes biases through continuous user oversight, and ensures that any issues of data privacy are managed through straightforward, explainable mechanisms. In this way, our approach supports the broader policy objectives of protecting civil liberties and maintaining public trust in AI deployments, while also driving efficiency and innovation.
- ✓ **Accessible to All:** We specifically designed Workforce AI's interface to be accessible for a wide range of employees and citizens interacting with the government, including older workers or those who are not tech savvy. Because our solution relies on natural spoken conversations and a visual avatar, employees with dyslexia or limited digital literacy can interact easily without needing advanced IT skills. This ensures that "everyone," not just tech-savvy staff, can benefit from AI's efficiency.

3.0 POLICY ROADMAP & ALIGNMENT WITH FEDERAL INITIATIVES

Our response is designed to directly support key federal mandates and efficiency directives:

- **EO 14158 & EO 14210:** These orders require agencies to reduce workforce size (1 hire per 4 departures) while maintaining service quality or increasing output. Our digital employees enable agencies to continue delivering essential services at a fraction of the cost, helping to offset mandated reductions by augmenting remaining staff.
- **DOGE & Government Efficiency Initiatives:** By providing measurable, rapid efficiency improvements, Workforce AI fits squarely into agency plans for digital modernization. Our solution can be incorporated into an agency's hiring plan presented to the President, ensuring that even in large-scale Reductions in Force (RIF), operational capacity and service quality remain high.

3.1 Workforce AI's Competitive Advantages in AI-Driven Workforce Augmentation

Workforce AI distinguishes itself from other AI platforms through a **user-first design philosophy** and practical features tailored to federal workforce needs. Our solution's competitive advantages directly address common barriers to AI adoption in large organizations:

- **Intuitive Human-User Interface:** Workforce AI features a **conversational, user-friendly interface** that requires no specialized training or coding expertise. Employees interact with the AI as naturally as they would with a colleague, asking questions or requesting support in plain language. This design lowers the barrier to entry dramatically. *Research shows that perceived usefulness and ease of use are the top factors influencing people's willingness to adopt AI.* By prioritizing clarity and simplicity, Workforce AI fosters immediate trust and comfort, unlike competing solutions that overwhelm users with technical complexity.
- **Ease of Use and Minimal Training:** Because of its intuitive design, Workforce AI can be rolled out with minimal training overhead. New users can be up and running in minutes, which accelerates organization-wide adoption. In contrast, many AI tools demand extensive onboarding or learning "prompt engineering" to get value, discouraging busy federal employees from using them. Workforce AI's **plug-and-play simplicity** ensures that even non-technical staff - from procurement officers to field agents - can harness AI assistance confidently. This ease of use translates to higher adoption rates and quicker ROI. Indeed,

technology adoption studies have long affirmed that if a system is not user-friendly, employees simply won't use it, derailing the initiative. Workforce AI squarely avoids that pitfall.

- **Augmentation Then Automation:** Our approach focuses on **augmenting human workers**, not replacing them. Workforce AI acts as a smart assistant that enhances employees' capabilities – whether by rapidly retrieving knowledge, performing tedious tasks, or offering decision support – while keeping the human in control. This philosophy contrasts with black-box automation solutions that attempt to entirely offload tasks and often face workforce resistance. By keeping federal employees actively engaged and **in the loop**, Workforce AI boosts **job buy-in**; staff see it as a tool that makes their jobs easier and more meaningful, rather than a threat. This drives enthusiastic adoption. *A recent survey found 71% of employees report increased job satisfaction when AI is integrated into their daily tasks, precisely because AI is helping with the grunt work and allowing them to focus on more rewarding responsibilities.* Workforce AI's augmentation model taps into that dynamic, leading to higher morale and acceptance across the board.
- **Seamless Integration with Workflows:** Workforce AI is designed to fit into existing federal IT environments, **not disrupt them**. Employees don't have to learn a new system or constantly switch contexts; the AI comes to their workflow. This stands in stark contrast to some enterprise AI solutions that force agencies to adopt entirely new software ecosystems or complex data pipelines. By **meeting users where they already work**, Workforce AI removes friction and shortens the learning curve. The result: faster deployment and **immediate productivity gains**, without the typical change-management headaches.
- **Knowledge Enhancement and Continuous Learning:** Beyond efficiency, Workforce AI serves as a **knowledge multiplier**. It can instantly access and surface institutional knowledge, policies, or best practices in response to an employee's query – effectively putting a real-time research assistant or trainer at every worker's fingertips. This not only helps get work done faster, but also **upskills the workforce over time** as employees learn from the AI's answers and recommendations. Competing AI solutions that are too convoluted or opaque fail to deliver this kind of shared learning. Workforce AI's straightforward explanations and sources build user knowledge and confidence. *Notably, 79% of employees believe that acquiring AI skills (and by extension, learning from AI tools) will help advance their careers, and nearly half of those saving time with AI reinvest that time in further training. Workforce AI capitalizes on this trend by actively encouraging knowledge transfer and growth on the job.*
- **24/7 Video Call Center Capability:** Workforce AI can embed a video-based digital employee on a public-facing website (e.g., IRS, VA, or Social Security) to handle routine citizen inquiries around the clock. Instead of waiting on hold for 30 minutes, citizens get immediate help through a user-friendly avatar that can speak naturally, display relevant forms, and even escalate if needed. This drastically cuts call volume, shortens wait times, and frees human agents for complex or sensitive cases. The net impact is a potential savings of millions of dollars annually in staffing costs, plus higher citizen satisfaction and zero backlog for straightforward requests.

In sum, Workforce AI's human-centric, **"AI made easy"** approach is purpose-built to drive widespread adoption and impact. Unlike overly complex platforms that remain underutilized or even unused, our solution is *ready for the federal workforce at scale*.

4.0 TECHNICAL & OPERATIONAL APPROACH

User Interface & Integration: Our HUI is the cornerstone of our solution. It translates complex AI functions into simple, conversational interactions that are easily understood by non-technical federal employees.

Workforce AI leverages the latest foundational models and incorporates built-in fact-checking and Retrieval-Augmented Generation (RAG) for comprehensive document analysis. Our platform can record video interactions for audit and quality control purposes, ensuring that every AI decision is transparent and reviewable. This robust technical foundation underpins our commitment to meeting all federal IT security standards.

It translates complex AI functions into simple, conversational interactions that are easily understood by non-technical federal employees.

Operational Impact: Increased interaction with our AI leads to faster knowledge acquisition among staff, which in turn supports further task automation and higher efficiency. Our early pilot data (and analogous industry benchmarks) indicate that organizations can save 20–30% of administrative time.

4.1 Implementation Roadmap

- **Phase 1:** Initiate a 90-day pilot with formal documentation (proposal, SOW, NDA) tailored to meet current agency needs.
- **Phase 2:** Use pilot outcomes to refine integration, then scale deployment across agency units.
- **Phase 3:** Expand the deployment to capture broader usage and long-term transformation.

4.2 Sample Use Cases

Beyond standard administrative tasks, some examples of what Workforce AI can replace:

- **Leadership & Employee Coaching:** Digital employees provide quick coaching tips or leadership best practices, gleaned from each agency's leadership framework.
- **IT Help Desk & HR Help Desk:** Whether resetting passwords or explaining benefits policies, the AI can autonomously resolve tickets or escalate to a human if needed.
- **Research Assistant:** Summarize or cross-reference large volumes of documents, supporting policy writers or staff with instant information retrieval.
- **Training & Onboarding:** Serve as a trainer for new hires or for advanced upskilling, walking employees through modules or simulations, 24/7, on demand and customized.
- **Social Worker/Support Agent:** For agencies like HHS or local social services, the digital employee can deliver guidance on eligibility, steps for applications, or handle common questions at scale.
- **VA Counselors & Benefits Advisors:** Provide immediate triage for veterans seeking info on benefits or healthcare, handle routine queries before a human counselor is engaged for more personal cases.
- **Legal Assistant or Proposal Writer:** Understand internal templates, auto-draft proposals or briefs, and gather key references from the org's database.

All of these scenarios highlight how Workforce AI can become a companion that helps employees offload busywork while ensuring consistent, accurate support.

4.3 Evidence of Impact: Simplicity Overcomes the AI Non-Adoption Gap

The promise of AI to reduce costs and supercharge productivity has been documented for years. Yet most AI solutions stall after initial pilots because employees simply do not use them in everyday workflows. In fact, an industry analysis revealed that the typical organization has 37 AI proof-of-concept projects, but only 5 make it to full production usage - primarily due to complexity. Similarly, surveys show that up to 86% of employees either reject or never fully embrace new AI tools also due to complexity.

Typical AI: Theoretical Gains, Rarely Realized

Despite studies indicating AI can reduce routine work by 30–40%, those advantages remain largely theoretical if staff find the tools too complicated to adopt. Many solutions require “prompt engineering,” specialized training, or navigating unfamiliar systems. Non-technical employees, especially, often revert to old manual workflows once initial excitement fades. Consequently, the vast majority of organizations never see AI’s advertised efficiency gains.

Workforce AI’s Difference: Real Adoption Through Simplicity

- **Human-Like Avatar:** By embedding a personable video agent into online meetings, websites, and daily tasks, employees interact with Workforce AI just by talking to it or typing a quick request. There’s no extra software to open or complex prompts to memorize.
- **Zero Technical Overhead:** Because staff can engage the AI as if it were a real colleague, any friction that kills typical AI deployments is eliminated.
- **Bridging Pilot to Production:** The same user-centric interface that impresses people in a trial remains intuitive long-term. Once employees see how easily they can offload repetitive tasks (scheduling, note-taking, form-filling) to a digital colleague, usage grows organically across federal agencies.

Overcoming the ‘5 out of 37’ Pitfall

Industry data shows most AI pilots fail to achieve permanent adoption. Workforce AI was built specifically to avert that fate: we prioritize user acceptance - no data science skills or prompt wizardry required. Our video-forward approach fosters trust, and straightforward onboarding spurs enthusiastic uptake. The result is a solution that’s used daily, not shelved post-pilot.

Simplicity Conclusion

Rather than listing hypothetical gains, Workforce AI delivers on-the-ground benefits by tackling the root cause of AI’s adoption gap: complexity. A complex AI solution with myriad features is worthless if nobody uses it; a simple, well-targeted AI assistant can transform every key metric - hours saved, errors reduced, morale boosted, and service delivery accelerated. We believe the National AI Action Plan should explicitly incorporate these lessons, steering federal AI deployments toward human-friendly design that guarantees genuine usage and ROI. Workforce AI proves that advanced AI can be both powerful **and** accessible, enabling agencies to move beyond theory and realize actual workforce transformation.

4.4 Security & Compliance

Ensuring robust **security, privacy, and regulatory compliance** is at the core of Workforce AI’s design. As federal agencies increasingly deploy AI-driven automation, compliance with government security standards, data privacy mandates, and risk management frameworks is

critical. Workforce AI is built to **seamlessly integrate into federal IT environments** while adhering to the highest security protocols and regulatory expectations.

1. **Data Security & Encryption Standards:** Workforce AI employs enterprise-grade encryption and zero-trust architecture to protect sensitive government data. All communications, user interactions, and stored information are encrypted at rest and in transit.
 - o **Encryption Standards:** AES-256 encryption for data at rest and TLS 1.2+ for data in transit, ensuring secure handling of federal information.
 - o **Role-Based Access Controls (RBAC):** Workforce AI implements multi-tiered authentication mechanisms to prevent unauthorized access.
 - o **Data Segmentation & Isolation:** AI models and storage infrastructures are compartmentalized to ensure agency-specific data remains isolated.
2. **Federal Compliance:** Workforce AI is designed to meet the highest federal security standards. Our robust security architecture - including enterprise-grade encryption and zero-trust protocols - already ensures compliance with NIST 800-53 and other federal mandates.
3. **AI Trust, Explainability, and Bias Mitigation:** Workforce AI ensures responsible AI development, reducing bias, opacity, and security vulnerabilities.
 - o **Human-in-the-Loop (HITL) AI Governance:** Every task the digital employee completes can be reviewed, overridden, or audited by a designated human kept in the loop.

Every task the digital employee completes can be reviewed, overridden, or audited by a designated human kept in the loop.

- o **Bias Detection & Fairness Models:** AI outputs are continuously analyzed to identify and mitigate algorithmic bias, aligning with federal AI fairness initiatives.

- o **Explainability Framework:** Workforce AI utilizes transparent AI models, allowing agencies to audit decisions, ensuring compliance with explainability mandates.

4. **Secure Federal Integration & Authentication:** Seamless integration into federal IT systems is critical for security and operational

efficiency.

- o **Identity and Access Management (IAM):** Integration with federal SSO solutions like CAC/PIV authentication and multi-factor authentication (MFA).
 - o **Cloud Flexibility:** Workforce AI supports hybrid deployments, allowing agencies to run AI solutions within federally controlled cloud environments.
 - o **Continuous Monitoring & Audit Logs:** Workforce AI automatically logs AI interactions, ensuring full auditability, traceability, and real-time threat detection.
5. **AI Security Against Threats & Adversarial Attacks:** Given growing AI-driven cyber threats, Workforce AI incorporates advanced security countermeasures.
 - o **AI Model Security:** Protection against model poisoning, adversarial inputs, and data exfiltration.
 - o **Zero-Day Threat Protection:** AI anomaly detection systems monitor for unauthorized behavior, suspicious data patterns, and cybersecurity risks.
 - o **Continuous Red Teaming & Security Testing:** Routine penetration testing ensures resilience against sophisticated cyber-attacks.

Workforce AI is purpose-built for secure, scalable, and compliant AI workforce augmentation within the federal government. By adhering to the strictest federal security frameworks, Workforce AI ensures agencies can deploy AI solutions with full confidence in security, privacy, and compliance.

5.0 POLICY RECOMMENDATIONS ALIGNED WITH WORKFORCE AI'S STRENGTH

Having demonstrated how a user-centric approach drastically boosts adoption, we now detail specific policy levers that can help the entire federal ecosystem achieve these benefits.

To fully harness AI for workforce augmentation, policy guidance and federal initiatives should align with the factors that make solutions like Workforce AI successful. We respectfully propose the following policy recommendations, which both **support the AI Action Plan's objectives and create an environment where Workforce AI's human-centric easy-to-use approach will thrive**:

1. **Prioritize User-Centric Design and Usability in Federal AI Procurement:** We recommend that the AI Action Plan include guidelines for agencies to evaluate AI solutions based on **ease of use, intuitiveness, and training overhead** as key criteria – on par with technical performance. Too often, procurement focuses narrowly on AI capabilities or accuracy, while neglecting the **human factor** that determines real-world adoption. By requiring evidence of high user acceptance (e.g. through pilot results or usability testing) before full deployment, policymakers can ensure the chosen AI tools will actually be embraced by federal employees. This user-centric procurement approach naturally favors solutions like Workforce AI, which are built around **human-friendly interfaces and quick onboarding**. It will discourage overly complex platforms that might look powerful on paper but fail to gain traction in practice. In addition, we suggest developing **AI usability standards or certification** (echoing the 57% of professionals who support certification for AI systems) to guide vendors in designing for simplicity and trust. Federal adoption of AI will accelerate if every solution is required to pass a “user-friendliness” test.
2. **Streamlined Procurement Pathways:** Advocate for innovative contracting methods (e.g., Other Transaction Authority or test-bed contracts) that allow rapid pilot deployment. This approach aligns with recent deregulation efforts and EO 14179, which emphasize removing barriers to technology adoption.
3. **Integration of AI in Workforce Training:** Include provisions for AI-driven upskilling programs, where federal employees can improve their job performance by interacting with a human-like AI knowledge hub that they can speak with conversationally, thereby boosting productivity and reducing training costs.

By framing AI as a collaborative partner, the government will alleviate employee fears and encourage active engagement with AI tools.

4. **Emphasize Augmentation and Human-AI Collaboration in Policy Frameworks:** The AI Action Plan should clearly articulate that the federal government's strategy is to **augment human workers with AI, not replace them**. This stance will set the tone for responsible AI integration that has broad workforce support. Concretely, policies could mandate that AI systems include **human-in-the-loop capabilities**, allowing employees to oversee, correct,

and learn from AI outputs. Agencies might be directed to start with use cases that **relieve**

employees of drudgery (data entry, routine research, simple customer queries) while **enhancing their ability to perform mission-critical tasks**, exactly as Workforce AI does. By framing AI as a collaborative partner, the government will alleviate employee fears and encourage active engagement with AI tools. This approach aligns with the documented finding that workers see AI as a “force for good” when it helps them be more effective. We also recommend that any ethical AI or job impact guidelines issued as part of the Plan highlight success stories of augmentation (where AI improved jobs and outcomes) to reinforce this narrative.

5. **Invest in AI Training, Change Management, and Knowledge Sharing:** To complement intuitive AI solutions like Workforce AI, agencies should invest in **training programs and change management** initiatives that prepare the workforce to make the most of AI. The Plan should allocate funding or resources for government-wide AI literacy programs, focusing on practical skills (e.g. how to interact with AI assistants, how to interpret AI suggestions) rather than technical development. Even though Workforce AI requires minimal training due to its simplicity, empowering employees with a baseline understanding of AI increases comfort and usage. Additionally, we propose establishing a **Federal AI Workforce Augmentation Council or working group** that facilitates knowledge sharing across agencies – so lessons learned and best practices (from pilot projects, for instance) can be disseminated. This could involve periodic cross-agency workshops or an online repository of use cases. By sharing success stories (for example, how one department saved thousands of hours with an AI assistant, or how another improved employee satisfaction scores through AI support), the government can build momentum and confidence in AI adoption. Such a council could also develop **common performance metrics** (e.g. hours saved, user satisfaction, cost savings) for AI workforce tools, which would guide agencies in evaluating solutions. Workforce AI’s deployments would readily showcase strong performance on these metrics, helping set benchmarks for the industry.
6. **Encourage Pilot Programs Focused on Quick Wins and Scalability:** We urge the NSF and policymakers to incorporate a “**start small, think big**” approach in the AI Action Plan. Specifically, encourage each federal agency to run **pilot projects** with AI solutions in targeted areas that can demonstrate quick wins (within 6-12 months) in efficiency and service delivery. Ideal pilot candidates are processes that are labor-intensive and repetitive yet rule-based – areas where Workforce AI excels. By structuring pilots to measure specific outcomes (time saved, reduction in backlog, employee feedback, etc.), agencies can build a proof-of-concept for broader AI rollout while managing risk. The policy could call for, say, at least one AI workforce augmentation pilot in each agency within the next year, with results reported back to a central body. Furthermore, we recommend requiring that these pilots consider **usability and adoption rates** as success criteria, not just raw output metrics. This ensures that solutions like Workforce AI, which score high with users, are recognized for their full value. Once a pilot succeeds, the Plan should streamline the path to scale it agency-wide (perhaps through fast-track procurement authorities or shared services frameworks). The end goal is a **federated network of AI-augmented teams** across government, all achieving more with less effort.
7. **Align AI Procurement Policies to Favor Flexible, Human-Centered Solutions:** Federal procurement regulations and grant programs can be tuned to favor our approach in subtle but powerful ways. For instance, solicitations for AI systems could require a **phase where end-users test the product and provide feedback** as part of the evaluation. This would naturally elevate vendors that prioritize user experience (like Workforce AI) over those that focus only

on technical specs. Scoring criteria can include user satisfaction scores from a trial period, or the percentage of target users who voluntarily adopt the tool – metrics where a human-centric solution shines. Additionally, policies might encourage **modular, interoperable AI services** (as opposed to monolithic systems). Workforce AI is modular and API or MCP driven, able to plug into various legacy systems and data sources securely. By valuing interoperability, the government avoids vendor lock-in and encourages the kind of flexible solution we provide. Finally, we advise incorporating language in the AI Action Plan around **continuous improvement requirements** – i.e., vendors must demonstrate the ability to update the AI with user feedback and new knowledge over time. This aligns with Workforce AI’s philosophy of evolving with the organization’s needs, and it weeds out static solutions that might quickly become obsolete or disliked by users. In short, thoughtful tweaks to procurement policy can create a market environment where the best **human-friendly, effective AI tools** rise to the top, to the benefit of the federal workforce.

8. **Support Innovative Small Businesses Startups in Federal AI Procurement:** We encourage policymakers to prioritize small, agile AI companies that often develop the most innovative solutions. Too often, large vendors overshadow emerging startups in the federal procurement process, stifling new ideas and competition. Providing set-asides or simplified acquisition pathways specifically for small U.S.-based AI businesses will foster diversity, spur more radical innovation, and ensure the benefits of advanced, user-friendly AI are widely available rather than concentrated in a few large incumbents.

These policy recommendations all point toward a common theme: **make “human-in-the-loop” and “ease of adoption” core pillars of the federal AI strategy**. By doing so, the NSF and federal leaders will set the stage for AI deployments that actually work in practice and deliver ROI. This approach naturally favors solutions like Workforce AI without needing to call them out by name - it simply creates conditions where any AI platform **must** prove it can be adopted and make a difference for real employees. We are confident that Workforce AI will exceed those standards, and we stand ready to help the government implement these policies through collaboration and demonstration.

6.0 COMPETITIVE POSITIONING

Workforce AI stands apart from competitors by offering the only digital employee solution that is easy to use, with a superior human user interface that drives genuine engagement and adoption. While other AI solutions are overly technical and complex, our system has been specifically designed for federal employees who need simplicity, efficiency, and real measurable savings.

Workforce AI uniquely addresses the government’s need for efficient, user-friendly AI tools by focusing on augmentation rather than complete automation.

Unlike traditional robotic process automation (RPA) or complex enterprise AI systems that require

extensive training and technical expertise, our solution is built around **a conversational, intuitive interface that federal employees can use with minimal onboarding**. This not only reduces resistance to adoption but also enhances productivity by allowing staff to quickly gain valuable insights and offload repetitive tasks. Our system’s seamless integration with existing

Workforce AI stands apart from competitors by offering the only digital employee solution that is easy to use, with a superior human user interface that drives genuine engagement and adoption

workflows and legacy IT systems further differentiates it from competitors that demand a complete overhaul of current infrastructure.

Workforce AI differs markedly from traditional solutions:

- **Against RPA Tools:** While RPA focuses on rule-based automation, requires technical setup and simply mimic keystrokes for rule-based tasks, Workforce AI leverages advanced natural language processing and a dynamic, human-like interface that manages both structured and unstructured tasks. It enables non-technical users to interact naturally, reducing adoption barriers and enhancing productivity, making it superior for federal workforce augmentation.
- **Compared to Basic Chatbots:** Traditional chatbots are limited to text-based interactions and require prompt engineering but cannot execute complex workflows. In contrast, Workforce AI's digital employees perform actions - from filling forms to integrating with legacy systems - while maintaining a friendly, conversational and intuitive interface.
- **Over Legacy AI Solutions:** Older AI systems often require extensive customization and fail to integrate with existing workflows. Our platform is designed for rapid deployment and seamless integration, ensuring immediate ROI.

6.1 Call to Action: Partner with Workforce AI for Pilot Programs and Future Procurement

To turn these recommendations into action, we propose a direct partnership between NSF/federal agencies and our team to **pilot Workforce AI in the federal environment**. We urge the NSF to consider **Workforce AI as a flagship example** of AI-driven workforce augmentation in its AI Action Plan and to facilitate introductions with agencies where our solution can immediately contribute. Specifically:

- **Launch Pilot Programs:** We invite federal agencies (perhaps via NSF's coordination) to **pilot Workforce AI in select departments or use cases**. Our proposed pilot structure includes a 90-day duration, starting with a kickoff meeting to define success metrics (e.g., hours saved, user satisfaction scores), followed by weekly check-ins, and concluding with a report on outcomes. We will provide dedicated support, including training sessions and integration assistance, to ensure smooth rollout and measurable results. For instance, piloting our AI assistant in an agency's HR department, grants management team, or customer service center could rapidly validate the benefits outlined above. We are prepared to offer **pilot-ready modules** of Workforce AI that address common government needs (such as an AI knowledge assistant for policy manuals, or an AI task helper for form processing). These pilots can be set up quickly, and we will work closely with agency stakeholders to define success metrics and ensure a smooth rollout. Our team will also capture metrics and user feedback throughout the pilot to quantify improvements in productivity, response times, and employee satisfaction. The insights gained can directly inform the AI Action Plan's final recommendations and help build a case for larger scale deployments. In short, **we stand ready to be a testbed and early success story** for the federal AI workforce augmentation initiative.
- **Schedule Demonstrations and Meetings:** We welcome the opportunity to present **Workforce AI in detail to NSF leaders and federal stakeholders**. A live demonstration would showcase how an end-user interacts with Workforce AI's intuitive interface and how the system delivers value in seconds. We can tailor demo scenarios to government contexts (e.g., an employee asking the AI to summarize the latest policy update, or to pull statistics for a briefing). Seeing the ease and power of our platform firsthand will reinforce the points made

in this response. We propose setting up a meeting or workshop where we can not only demo the technology but also discuss implementation strategies, security and compliance (Workforce AI is designed with federal security requirements in mind), and how it aligns with specific Agency missions. Such discussions will help identify the best initial use cases and address any questions early, smoothing the path for pilot approval. **Our calendar is open to meet at NSF's convenience** - the sooner we connect, the sooner we can turn AI policy into on-the-ground results.

- **Forge Strategic Partnerships:** Beyond pilots, we are eager to form longer-term **partnerships with federal agencies and research institutions** to advance AI workforce augmentation. This could include cooperative research and development agreements (CRADAs), joint innovation labs, or inclusion in any **AI Centers of Excellence** that the Action Plan envisions. By partnering with Workforce AI, the government can leverage our ongoing R&D in areas like explainable AI, domain-specific knowledge models, and user experience enhancements for public-sector workflows. We, in turn, benefit from real-world usage that guides our product refinement. It's a mutually beneficial cycle of innovation. We are also open to collaborating on **grant proposals or sandbox programs** that NSF might sponsor to study AI's impact on the workforce. If NSF plans to fund testbeds or academic-government-industry collaborations as part of the Action Plan, we would be excited to contribute our platform and expertise. Our goal is to ensure that federal employees have a voice in shaping the AI tools they use - and partnership is the vehicle to achieve that.
- **Prepare for Scaled Procurement:** Finally, as the AI Action Plan moves toward execution, we want to ensure Workforce AI is well-positioned for any **future procurement opportunities** that arise. We ask NSF for guidance on upcoming acquisition programs or innovation challenges that align with our solution. Knowing the timelines and criteria in advance will help us align resources and possibly tailor certain features for federal needs. We are already investing in the compliance and certification aspects that would make adoption in government seamless. As policies and RFI responses turn into RFPs and contracts, **Workforce AI will be ready to compete and win** on the merits of its value proposition. We simply seek a fair opportunity to demonstrate that value at scale. The call to action here is: keep human-centric AI like Workforce AI in focus as the government defines its acquisition roadmaps, and leverage the private sector innovation available rather than building from scratch. We are one of the innovative firms eager to serve.

7.0 CLOSING

We urge the National Science Foundation and federal AI leaders to move decisively in adopting AI-driven workforce augmentation - **and** to do so in a way that emphasizes usability, real-world adoption, and human empowerment. Workforce AI stands ready as a willing and able partner to achieve those goals. By implementing our policy recommendations and initiating pilot programs, the federal government can unlock **dramatically higher productivity, improved employee satisfaction, and substantial cost savings** - positioning the United States as a model employer in the new AI era.

Analysts predict AI could boost overall labor efficiency by about 30% and save thousands of hours across federal agencies, but only if deployed effectively. **Let's seize this moment** with a solution built for real usage: an intuitive, **humanlike digital employee** that *complements* existing staff rather than complicating their work. In doing so, the government can **strengthen operational efficiency, uphold security and transparency standards, and reinforce America's leadership in AI innovation.**

Workforce AI is a strategic asset that can empower the federal workforce, drive operational efficiency, and supports the U.S. in its quest for technological leadership. By embedding our easy-to-use AI into existing systems, we embody the principles of innovation, American entrepreneurial scrappiness, risk management, and sustainable growth. We invite federal stakeholders to partner with us in pilot programs to **reinvent the workforce**: as Americans, we must dream big about AI's limitless potential – and then be pragmatic enough to ensure it truly meets human needs. By anchoring AI in simplicity and human-centric design, Workforce AI will help unlock a new era of productivity that preserves empathy, oversight, and trust.

We appreciate your consideration of this response and look forward to helping implement the National AI Action Plan. To explore next steps, we welcome the opportunity to schedule a demonstration or meeting. Together, we can empower the federal workforce with approachable, human-centric AI and set a bold example of public sector innovation. **We stand ready to partner with agencies in realizing an AI-augmented future that benefits everyone.**

Thank you for the opportunity to contribute. We look forward to collaborating on making the vision of an AI-augmented federal workforce a reality.
