Hello,

I'm an artist and author, and the way generative AI relies on my work (without my consent) to function and improve, is inherently anti-creative and anti-innovation. It goes against what it means to be creative, what it means to be innovative. It's also simply theft with extra steps.

Exempting generative AI development from copyright law and allowing them free reign to have anything they want to train off of without recourse sets a dangerous precedent, and it **ONLY** benefits the big companies, not the individuals who **made the art in the first place that got stolen to be fed into a machine.**

The creative industry - art, writing - is what makes the media industry so strong. To try and make AI replicas to replace the human behind the art will hollow out and remove any chance of innovation. If a human can't make art because their job was replaced with AI that took their work to exist, then when that AI needs "improvement" via more art, there is NONE because the human can't afford the time to make art anymore when they are no longer employed, and have to focus on trying to do anything else to make ends meet.

And to find more human artists who, maybe they miraculously do not need to work for survival, and have the time to make new art, their work would be even harder to find given the amount of generative AI images and text that is already out there.

There are also huge energy-consumption concerns when it comes to the sheer amount of energy needed to generate AI content. We are struggling as-is with switching to renewable alternatives so as to secure our kids' futures in a hopefully cleaner world. I would emphasize **FIRST** on renewable energy innovation before attempting to "race" with AI when there are catastrophic consequences to not having a solid, climate-conscious plan forward.

There are no winners in the long run, and I urge companies and people to stop thinking about short-term goals and to see the bigger picture. **Generative AI should be regulated into only training off public domain and consent-given, contractually made art and writing, and AI should no longer be used in efforts to *replace* whole industries.**

It's a race to the bottom otherwise. Highly emphasize not allowing AI companies exemptions to copyright laws and to instead focus on renewable energy before committing to huge generative AI outputs.

Thank you for your time!
Yukimi
