Zac Goldfain, [REDACTED]

My name is Zac Goldfain and I am a 2nd semester senior at AVonworth High School, I studied generative AI and its impact on Sports Management for two months in a course on AI and Ethics this year. From my research, I think this current administration's viewpoint on AI regulation is putting our nation in the right direction. While researching AI in Sports Management, I was able to see various ways in which AI was beneficial to those in the field. Sports in our country are one of, if not the most televised things of today. They create unity with fanbases and competitive rivalries that many people live for. AI's impact on sports has continued to grow rapidly and with our new administration, I believe American sports can become the largest worldwide in every aspect. With AI's improvements, many big sports teams have been able to collect data and quickly find ways to improve their teams. Whether it's player health, game strategy, or behind-the-scenes management, AI has simplified the sports world and made sports safer for athletes while also growing viewership for fans. Athletes are what allow us to watch sports, therefore making their health and safety a priority. AI's new developments have allowed medical staff to track player injuries and healing progress, giving athletes the ability to play at their peak performance. If we continue to develop AI in the right direction, it will significantly help in the sports world, which we all know and love in our nation.
