I respectfully submit the enclosed proposals to the Office of Science and Technology Policy for consideration in the development of a new AI Action Plan. As U.S. companies lead advancements toward artificial general intelligence (AGI) and eventually artificial superintelligence (ASI), we stand at a critical turning point that could significantly reshape global power dynamics.

The Chinese Communist Party (CCP) is aggressively pursuing dominance in AI, leveraging substantial resources, including forced labor practices. As the leader of the free world, the United States has a responsibility to ensure that AI development remains rooted in democratic principles and does not permit authoritarian regimes, like China, to spread autocratic influence through AI technologies. Below are my suggestions to achieve this goal.

Sustaining U.S. AI Leadership and Innovation

America must vigorously invest in AI research and development (R&D) through increased federal funding to agencies like NSF, DARPA, and DOE. Public-private partnerships should expand to drive innovation and commercialization of AI breakthroughs. Establishing a lightweight National AI Research Infrastructure will establish a framework for access to essential computing and data resources, supporting research institutions nationwide.¹

Unlike our allies in Europe², American policy frameworks should prioritize innovation-friendly environments for the private sector, minimizing restrictive regulations, while maintaining open innovation through publicly available datasets, IP protections, and support for open-source development.

Countering International AI Competition

China and other nations are rapidly advancing their AI capabilities³, making strategic competition imperative. The U.S. must protect its leadership by investing significantly in semiconductors, edge computing, and strategic AI applications, ensuring secure domestic supply chains.

Targeted export controls and tariffs should safeguard sensitive technologies⁴ and bolster American dominance⁵ in AI without isolating American firms from global markets.

Ensuring AI Access for All Americans

To avoid exacerbating the existing technical deficiency in our population, the U.S. must ensure universal broadband access, particularly in rural and economically disadvantaged areas, enabling full participation in AI-driven services.⁶ Additionally, expanding community technology centers, AI labs, and computing resources will promote access to all Americans.

In education, AI literacy must be integrated at all levels. Federal grants should support schools to introduce AI-focused curricula, while workforce initiatives should offer AI skills training and upskilling programs.

National AI Infrastructure and Research Priorities

Establishing a permanent National AI Research Resource (NAIRR) is essential, providing AI researchers access to advanced computational tools.⁷ Investments should also target regional AI innovation hubs and support the development of energy-efficient data centers.

Expanding open datasets in critical sectors like transportation, health, and climate resilience will empower startups and academia to develop innovative solutions efficiently.

Governance Frameworks for Responsible AI Innovation

Governance should adopt flexible, risk-based frameworks, emphasizing voluntary adherence to standards like the NIST AI Risk Management Framework.⁸ Regulatory sandboxes and voluntary certification programs should be encouraged to build trust without hindering innovation.

An AI Advisory Council comprising stakeholders from academia, industry, civil society, and government should regularly evaluate and recommend governance adjustments.

Building an AI-Ready Workforce

The U.S. must significantly expand its domestic AI talent pipeline through enhanced STEM education programs nationwide. Dedicated AI-focused curricula and scholarship programs at universities, community colleges, and vocational schools should be prioritized.⁹

A national AI Upskilling Initiative could provide apprenticeships and retraining opportunities for workers impacted by automation, supported by federal incentives. Our country must aggressively pursue an “build from within” philosophy toward our AI workforce of the future.

Accelerating AI Adoption in Government and National Security

Federal agencies should lead by example, integrating AI solutions across operations, facilitated by Chief AI Officers and a centralized AI Center of Excellence.¹⁰ A dedicated AI modernization fund would incentivize impactful AI-driven projects.

The Department of Defense must accelerate AI adoption to maintain strategic superiority, including enhanced funding for the Joint Artificial Intelligence Center and agile procurement processes.¹¹ Intelligence and cybersecurity capabilities must also leverage AI to strengthen national defense.

A formal national security coordination body will ensure strategic alignment and effective governance of AI technologies across government agencies.

Conclusion

This comprehensive, policy-driven strategy will sustain America's global AI leadership, promote access, and secure economic and national security advantages through responsible AI development and deployment. I appreciate this opportunity to contribute and stand ready to support the implementation of the AI Action Plan.
