Introduction

ZealStrat is pleased to submit these comments in response to the National Coordination Office (NCO) and Office of Science and Technology Policy (OSTP) Request for Information regarding the development of an AI Action Plan. ZealStrat is a strategic advisory organization with expertise in artificial intelligence (AI) governance, risk assessment, and innovation policies. ZealStrat's mission is to help public and private organizations responsibly harness the power of emerging technologies, especially AI, for sustainable growth.

We commend the Administration's efforts to identify priority actions that will foster a robust and dynamic AI ecosystem across the United States, while addressing safety, security, and ethical considerations. Below, we provide our perspective on eight focus areas, which we believe are crucial to ensuring that U.S. leadership in AI is sustained and enhanced.

1. Creating Economic Value Through AI

Overview

AI technologies present significant opportunities for job creation, productivity gains, and overall economic advancement across industries. By strategically integrating AI into sectors such as manufacturing, healthcare, and logistics, policymakers can help businesses of all sizes become more resilient and globally competitive. However, realizing these benefits requires targeted incentives, robust infrastructure development, and a clear framework for measuring AI's economic impact. AI's immense computational power also holds the promise of accelerating scientific discoveries—ranging from identifying new energy sources to uncovering previously unknown physical and chemical properties of matter, ultimately propelling humanity's progress in fields like biology, sub-atomic physics, and space exploration.

While these transformative possibilities should be at the heart of our AI strategy, many organizations currently focus on using AI primarily to achieve operational efficiencies and trim costs, with the likely side-effect of leaving large numbers of people unemployed. This short-sighted approach threatens not only the long-term sustainability of AI development but also the consumer base that businesses rely upon. Instead, companies should use AI to not only boost productivity but empower employees through upskilling and adaptation, ensuring that economic gains and opportunities are broadly shared. By fostering a balanced approach—investing in people as well as technology—AI can truly serve the collective good, fueling innovation and prosperity for all.

A. Incentivize AI Adoption Across Diverse Sectors

- **Targeted Sector Grants and Tax Incentives**
 - o Provide grants, subsidies, or R&D tax credits for AI projects in key sectors (e.g., manufacturing, healthcare, logistics, energy) that demonstrate potential for **job creation** and **productivity gains**.
 - o Encourage AI applications that unlock new scientific frontiers (e.g., energy sources, novel materials, biotech breakthroughs) with the potential to transform entire industries.

This document is approved for public dissemination. The document contains no business-proprietary or confidential information. Document contents may be reused by the government in developing the AI Action Plan and associated documents without attribution.

- **Industry-Specific AI Pilots**
 - o Establish pilot programs within federal agencies (e.g., Departments of Energy, Agriculture, Defense) to test advanced AI solutions.
 - o Showcase successful pilots to **accelerate adoption** across the public and private sectors, ensuring small and medium enterprises also benefit from these insights.

B. Foster Robust Infrastructure and Research Capacity

- **High-Performance Computing (HPC) and Data Centers**
 - o Expand funding for national HPC centers to support AI research—especially projects exploring new energy discoveries, physics, and space research. The goal should be to challenge the norm, advance the technology and foundational science, and re-imagine their applications with the help of AI.
 - o Offer cost-sharing or low-interest loan programs for companies building AI-focused data centers, particularly in economically distressed regions.
- **Public-Private Research Collaboration**
 - o Create federal “AI Science Challenge Funds” to co-invest in large-scale research with private partners, focusing on areas like **sub-atomic physics, medical research, and advanced materials**.

C. Upskill and Retain the Workforce

- **National AI Upskilling Initiative**
 - o Launch a coordinated federal program offering short-course certifications, apprenticeships, and training stipends to **retool workers** for AI-intensive roles.
 - o Collaborate with community colleges, vocational schools, and industry associations to ensure **affordable, accessible** AI and digital training.
- **Workforce Retention Incentives**
 - o Offer tax benefits or matching grants to companies that expand their AI operations **while retaining or retraining** current employees, rather than opting for layoffs.
 - o Recognize and reward organizations that demonstrate a **people-first** approach—innovating through AI without undermining the broader consumer base.

D. Promote Responsible Corporate Behavior

- **Adaptive Corporate Governance**
 - o Encourage larger firms to adopt **responsible AI charters**, committing to reinvest a portion of AI-driven productivity gains into workforce development, new product lines, or public R&D partnerships.
 - o Establish voluntary recognition programs—public “Responsible AI” badges—for companies that exemplify a **balanced** approach to AI-driven transformation and workforce retention.
- **Stakeholder Engagement and Reporting**
 - o Require AI-driven companies of a certain size to publish **annual disclosures** detailing how AI adoption has impacted their employment levels, salaries, and investments in training.

- o Mandate transparent communication on Company's **long-term workforce strategy**, ensuring that employees, investors, and the public understand the company's commitment to shared prosperity.

E. Measure and Track Economic Impact

- **Standardized Metrics & Dashboards**
 - o Develop a unified set of **AI impact indicators** (e.g., GDP contribution, jobs created, productivity growth, R&D output) and display them on a public-facing federal dashboard.
 - o Use these metrics to periodically review, adjust, or **sunset** incentives and regulations as the market evolves.
- **Periodic Policy Reviews**
 - o Convene an **AI Economic Advisory Council**—comprising policymakers, industry leaders, and academic experts—to evaluate the effectiveness of incentives, workforce programs, and research initiatives every year.
 - o Update policies promptly based on data-driven insights, keeping pace with new technologies and **global competition**.

Summary

By adopting these focused strategies—ranging from **targeted sector incentives** and **robust infrastructure** funding, to **workforce upskilling** and **responsible corporate governance**—the Administration can capitalize on AI's transformative potential. This balanced approach ensures that productivity gains do not come at the expense of widespread job loss or weakened consumer demand. Instead, it fosters **inclusive economic growth**, fuels **scientific discovery**, and strengthens the United States as a global leader in AI-driven innovation.

2. Regulation and Governance

Overview

Effective AI governance is a cornerstone of building and maintaining public trust in AI-driven systems. It requires a flexible, risk-based approach that protects civil liberties, national security, and public welfare—while also fostering innovation and economic growth. Drawing on our Ethical AI expertise, ZealStrat recommends leveraging recognized frameworks and standards (e.g., IEEE CertifAIED™) to align government oversight with private-sector best practices and ensure that AI deployments remain transparent, accountable, fair and robust, while maintaining the expected level of privacy. A harmonized, risk-based governance framework should emphasize flexibility to accommodate evolving technologies and include clear mechanisms for transparency and accountability.

Importantly, the Federal Government should not serve as a vast regulatory entity—akin to the FDA (Food and Drug Administration)—managing millions of AI applications and certifications, as this would introduce significant inefficiencies and waste taxpayer dollars. Instead, we propose the use of **accredited third-party assessors** who can objectively evaluate AI systems under the guidance of globally recognized standards bodies, such as IEEE. These organizations would be responsible for updating and maintaining the relevant frameworks, as well as training enough

This document is approved for public dissemination. The document contains no business-proprietary or confidential information. Document contents may be reused by the government in developing the AI Action Plan and associated documents without attribution.

assessors to meet demand. The Federal Government's role could then be more efficiently focused on approving and monitoring these ethical AI and AI risk frameworks, maintaining a publicly accessible list of endorsed standards. This streamlined approach protects consumers and promotes national interests without unnecessarily slowing innovation in the AI space.

A. Establish a Standards-Based AI Governance Framework

- i. **Adopt Globally Recognized Standards:**
 - o **IEEE CertifAIEd™:** Provides a structured ethics and risk assessment framework that integrates societal values, covering a comprehensive set of Ethical Foundational Requirements for privacy, transparency, algorithmic bias, and accountability—offering a way to earn a globally recognized **trustmark** for ethical AI systems that satisfy these requirements.
 - o **NIST AI RMF:** Encourages organizations to identify, measure, manage, and monitor AI risks across the lifecycle of AI system design, development, and deployment, supporting them with practical insights from better practices across multiple industries and applications..
- ii. **Drive Consistency and Comparability:**
 - o Using **common terminology** and reporting structures for AI risk management facilitates consistent regulation and **cross-sector benchmarking**.
 - o Simplifying regulatory compliance for organizations that operate both nationally and internationally supports broader U.S. competitiveness in AI.
- iii. **Encourage Continuous Monitoring, Improvement, Compliance and Feedback Loops:**
 - o Mandate **periodic reviews** or audits to ensure that AI systems adapt to rapidly changing technologies and regulatory requirements.
 - o Reward organizations that **go beyond baseline compliance** by adopting more rigorous certifications, and earn trustmarks such as IEEE CertifAIEd™.
 - o Implement post-deployment monitoring and user-feedback mechanisms to catch emerging issues and support agile model updates.

B. Incentivize Ethical and Responsible AI Deployment

- i. **Public-Private Partnerships:**
 - o Collaborate with industry leaders, academia, and standards bodies (e.g., **IEEE**) to develop practical guidelines that strike the right balance between oversight and innovation.
 - o Offer **innovation grants** or tax incentives for organizations investing in **human-centric AI**, explainable models, and **robust safety testing**.
- ii. **Certification and Trustmarks:**
 - o Encourage agencies and private organizations to seek trusted certifications. For example, **IEEE CertifAIEd™** can add a **tangible seal of approval**, demonstrating that an AI system meets rigorous ethical and safety standards.
 - o Public communication of applicable standards and assessment organizations that would sufficiently fulfill the AI safety and risk regulations. This will help **end-**

users and government buyers identify vendors committed to responsible, secure AI, and foster transparency in the selection of such vendors.

C. Proactive Risk Management and Liability Clarity

- i. **Contextual Risk-Based Controls:**
 - o Implement **tiered oversight** based on an AI system's potential for harm. High-impact domains (e.g., healthcare, finance, Insurance, public safety) may require **more stringent safeguards** and advanced system explainability.
 - o Encourage organizations to **map, measure, and manage** AI-related risks continuously, aligning with recognized frameworks like **IEEE** and **NIST** to stay ahead of emerging threats and liabilities.
- ii. **Legal and Regulatory Certainty:**
 - o Clearly define **developer vs. deployer** responsibilities to provide clarity on **liability** in cases of erroneous or biased outputs (e.g., AI used in hiring decisions or critical resource allocations). Emerging AI legislation, such as Colorado's AI Consumer Protection Act, have pointed to the need for stakeholders across the entire AI system lifecycle to be appropriately held accountable.
 - o Standards organizations like IEEE should continuously incorporate insights from recent legal precedents (such as lawsuits alleging AI-based discrimination) to refine **risk assessment** and compliance guidelines. This approach ensures the U.S. AI ecosystem remains both globally competitive and **legally resilient**.

D. Cultivating a Culture of Ethical AI

- i. **Organizational AI Ethics Committees:**
 - o Encourage the formation of **intra-organizational AI ethics boards** or committees that align R&D teams, legal departments, and C-suite executives on AI governance decisions and accountability structures.
 - o Educate and Train employees: Incorporate a culture of **risk awareness** where employees at all levels understand the **ethical dimensions** of AI development and deployment.
- ii. **Public Education and Stakeholder Engagement:**
 - o Sponsor **public outreach programs** to demystify AI technologies, highlighting both their capabilities and their limitations.
 - o Engage with non-profit organizations like IEEE Standards Association, consumer advocates, and community stakeholders to **co-design** or refine AI policies, ensuring **broader input** on societal and ethical implications.

E. Looking Ahead: Adaptability and Future-Proofing

- i. **Periodic Policy Updates:**
 - o Given the rapid evolution of AI, regulatory agencies should **evaluate** and **update** relevant regulations and advisory guidance on a regular cycle (e.g., every 12–18 months) to keep pace with technological advancements and evolving societal expectations.

This document is approved for public dissemination. The document contains no business-proprietary or confidential information. Document contents may be reused by the government in developing the AI Action Plan and associated documents without attribution.

- o Encourage agencies, industries, and standards bodies to convene in **joint forums** to share lessons learned and **emerging best practices**.
- ii. **Forward-Looking Governance:**
 - o Promote research into **next-generation AI technologies** (e.g., neuromorphic computing, quantum-assisted AI, advanced generative systems) to **anticipate** new ethical, legal, and economic considerations.
 - o Develop contingency plans and **policy frameworks** that account for breakthroughs and disruptive AI applications—ensuring the **AI Action Plan** remains relevant and resilient over time.

Conclusion

A modern, standards-driven approach to AI regulation and governance—bolstered by the **IEEE CertifAIED™** and **NIST AI RMF**—will equip U.S. policymakers and stakeholders with the **tools** they need to **drive innovation and ensure safety**. By combining clear oversight structures, incentivizing ethical practices, and committing to periodic framework updates, the U.S. can cement its leadership in AI while safeguarding the public interest and reinforcing **long-term trust** in emerging technologies.

3. Model Development and Assurance (Explainability)

Overview

Explainability and transparency of AI models are critical for building public trust and ensuring responsible deployment, particularly in high-risk, and potentially high-reward domains such as healthcare, finance, and public safety. Clear, interpretable outputs can help stakeholders identify and mitigate issues like algorithmic bias, model drift, and unintended consequences.

Key Recommendations

- i. **Tailored Explainability**
 - o Require context-specific explainability protocols: detailed explanations in sensitive uses (e.g., medical diagnoses) and lighter-touch approaches for lower-risk scenarios.
- ii. **Verification & Validation Frameworks**
 - o Adopt standardized testing methods (e.g., stress tests, red-teaming) to detect potential failure modes or biases before wide-scale deployment.
 - o Encourage or mandate **external audits** of critical AI systems, leveraging recognized standards (e.g., IEEE CertifAIED™) to evaluate transparency, bias risks, and overall model fitness
- iii. **Continuous Monitoring and Feedback Loops**
 - o Implement post-deployment monitoring and user-feedback mechanisms to catch emerging issues and support agile model updates.

4. Cybersecurity and Data Privacy

Overview

With AI systems increasingly relied upon to process vast quantities of sensitive information, cybersecurity and data privacy have become foundational to maintaining trust and ensuring safe outcomes. Robust safeguards must be embedded throughout the **AI lifecycle**—from data collection and preprocessing to model training, inference, and ongoing maintenance. By adopting **secure-by-design** (<https://www.cisa.gov/securebydesign>) and **privacy-by-default** principles, organizations can protect against malicious attacks, minimize data exposure risks, and preserve individual rights.

A. Risk-Based Cybersecurity Strategies

- i. **Promote Secure-by-Design Development**
 - o **Mandate** a systematic review of potential attack vectors (e.g., data poisoning, model inversion, adversarial inputs) to guide security measures.
 - o Layer multiple security controls—such as encryption, intrusion detection, and continuous monitoring—throughout the AI workflow.
- ii. **Lifecycle Monitoring and Incident Response**
 - o **Ongoing Assessments:** Periodically audit AI systems to detect vulnerabilities early and address them promptly.
 - o **Standardized Protocols:** Promote consistent incident response procedures aligned with NIST Cybersecurity Framework guidelines, ensuring timely containment and mitigation.
- iii. **Third-Party Validation**
 - o Similar to the **Regulation and Governance** recommendation, leverage **accredited assessors** that specialize in cybersecurity evaluations. These assessors can ensure AI models and infrastructure meet recognized technical standards (e.g., ISO/IEC 27001, IEEE CertifAIED™ security benchmarks) without imposing excessive federal oversight.

B. Privacy-by-Default and Data Protection

- i. **Data Minimization and Purpose Limitation**
 - o **Collect Only What's Needed:** Government and industry stakeholders should adopt policies that limit data gathering to what is necessary for the model to reliably serve its intended application - no more, not less.
 - o **Purpose Clarity:** Clearly define how data will be used, shared, and retained, with **transparent consent** mechanisms for end-users.
- ii. **Technical Privacy Approaches**
 - o **Differential Privacy and Encryption:** Encourage advanced techniques (e.g., homomorphic encryption, secure multiparty computation) to protect sensitive data in training or inference.
 - o **Secure Data Storage:** Mandate robust security practices for data at rest and in transit (e.g., encryption, secure enclaves), ensuring consistent safeguards across the supply chain.
- iii. **Certification of Privacy Frameworks**

This document is approved for public dissemination. The document contains no business-proprietary or confidential information. Document contents may be reused by the government in developing the AI Action Plan and associated documents without attribution.

- o Create a **federal registry of approved privacy standards** (e.g., IEEE CertifAIED™, ISO 27701) that public agencies and private companies can adopt.
- o Federal oversight can be limited to **reviewing and endorsing** these frameworks—rather than becoming a large regulatory apparatus—thereby reducing administrative burden and accelerating compliance.

C. Collaborative Governance for Cybersecurity and Data Privacy

- i. **Public-Private Partnerships**
 - o **Information Sharing:** Encourage sector-wide intelligence exchanges on emerging threats and best practices.
 - o **Joint Incident Exercises:** Promote simulation drills across agencies and industries to test readiness and resilience against AI-specific cyber threats.
- ii. **Continuous Standards Evolution**
 - o Work closely with recognized standards bodies (NIST, IEEE) to update cybersecurity and privacy guidelines in response to **new AI capabilities** and **emerging vulnerabilities**.
 - o Ensure standards remain flexible, avoiding **one-size-fits-all** mandates that may stifle AI innovation and progress with novel applications.
- iii. **Transparency and Accountability**
 - o **Audit Trails and Logging:** Require that AI systems maintain logs of critical data processing events, enabling traceability for security investigations.
 - o **Public Reporting:** Incentivize voluntary disclosure of data breaches or system vulnerabilities, reinforcing public trust and improving collective defenses.

Conclusion

By combining **risk-based cybersecurity strategies** with **privacy-by-default principles** and leveraging **third-party certification**, the Federal Government can help ensure that AI systems remain both **innovative** and **secure**. A **federated** approach—where official agencies endorse robust standards bodies and maintain a curated list of approved frameworks—avoids the inefficiency of direct government involvement in every stage. This model protects the public interest while fostering a competitive, responsible AI ecosystem that upholds user trust at all times.

5. International Collaboration Framework and Competition

Overview

Issue 1: Protecting U.S. Innovations

The United States invests heavily in advanced research and development, striving to create game-changing AI technologies. Yet certain foreign adversaries—sometimes referred to as “rogue states”—exploit hacking, industrial espionage, or illicit financial incentives to access U.S. technology at minimal cost. This poses an unfair threat to U.S. firms and workers, undermines incentives for legitimate innovation, and compromises American competitiveness. A more robust

strategy is needed to protect American intellectual property (IP) and deter unauthorized technology transfers.

Issue 2: Upholding Ethical Standards Amid Global Competition

Ethical values—derived from humanitarian, cultural, or religious principles—are core to the U.S. identity and serve as a guiding force in AI development. Nevertheless, countries that do not prioritize such ethical considerations can deploy AI without safeguards, moving at a faster but riskier pace. While this might create short-term competitive disadvantages for American enterprises, resorting to unethical methods in response is neither morally acceptable nor strategically sustainable. Over time, AI solutions that harm or exploit people tend to lose public trust. Therefore, the United States must maintain a **high ethical bar** in AI while preventing rogue or unethical AI solutions from undercutting American standards in both domestic and allied markets.

Actionable Recommendations

1. Strengthen IP Protections and Deterrence Measures

- o **Federal Technology Security Office:** Establish or empower an existing federal body to coordinate AI-related IP protections across agencies (e.g., Commerce, State, Defense) and to respond swiftly to cyber intrusions or industrial espionage attempts. Continue ongoing initiatives for the United States Patent and trademark Office (USPTO) to better identify and protect innovations, with a statutory right for such protection, protecting IPR-owners' right, and thereby promoting innovation of AI-enabled systems that benefit society.
- o **Enhanced Legal Frameworks:** Strengthen penalties for individuals and entities involved in corporate espionage or unauthorized technology transfers, ensuring the legal deterrents match the severity of the offense.
- o **Export Controls and Screening:** Bolster current export control mechanisms to cover critical AI software, hardware, and data assets, thereby preventing adversarial entities from siphoning U.S. technology.

2. Require U.S. Certification for Foreign AI Solutions

- o **Standards-Based Entry:** Mandate that any AI technology imported or used in the U.S. meet certification requirements set by approved organizations such as IEEE, focusing on data privacy, security, and ethical considerations. Much like the regulatory approach in the medical, pharmaceutical, and food industries, this ensures that only AI solutions meeting rigorous safety and ethical standards gain market access.
- o **Allied Reciprocity:** Coordinate with international allies to recognize shared AI certification frameworks, collectively refusing market access to AI solutions that fail to meet these frameworks' rigorous ethical and security standards.
- o **Periodic Reassessment:** Require periodic compliance audits to ensure continuous adherence to evolving U.S. guidelines and ethical benchmarks.

3. Promote a Unified Ethical AI Strategy with Allies

- o **Allied Task Force:** Form a multinational task force comprising key partners (e.g., NATO members, G7 countries, or other allies) to discuss AI ethics, share threat intelligence, and develop joint strategies for preventing the spread of malicious AI tools.

This document is approved for public dissemination. The document contains no business-proprietary or confidential information. Document contents may be reused by the government in developing the AI Action Plan and associated documents without attribution.

- o **Cross-Border R&D:** Encourage co-funded research programs that allow allied nations to pool AI expertise, emphasizing shared values like transparency and human rights. This collaboration fosters technological parity and mutual economic benefits.
4. **Accelerate America's Ethical AI Ecosystem**
- o **Talent Retention and Growth:** Increase specialized visa slots and incentives for top AI talent from around the world to remain in the U.S., helping to bolster America's leadership in cutting-edge research.
 - o **Support for Ethical AI Incubators:** Fund incubators and accelerators focusing on AI solutions that meet rigorous ethical standards—especially those that serve national security, healthcare, energy, or other high-priority sectors.
 - o **Public Awareness Campaigns:** Launch educational programs and public outreach initiatives highlighting the importance of ethical AI, helping U.S. citizens understand why certain foreign AI solutions may be restricted.

Conclusion

By deploying robust IP protection measures, requiring all AI solutions including domestic and foreign AI solutions, to adhere to the ethical standards recognized by the United States. And collaborating with allies on this unified approach, the United States can safeguard its technological edge, uphold ethical principles, and maintain global leadership in AI innovation. This balanced strategy reflects American values, secures national interests, and ensures that AI's long-term benefits are both sustainable and equitable. Moreover, this approach will level the playing field for all competitors and global players to have healthy competition.

Conclusion

ZealStrat appreciates the opportunity to provide input for this AI Action Plan. We encourage the Administration to adopt policies that support responsible AI innovation, sustainable economic growth, as well as efficient and effective governance. By balancing regulatory prudence with flexibility for emerging technologies, the United States can maintain its global leadership in AI while safeguarding public trust and national interests.
