ShiftIQ Response to Request for Information on the Development of an Artificial Intelligence (AI) Action Plan by the Networking and Information Technology Research and Development Program

*This document is approved for public dissemination. The document contains no business-proprietary or confidential information. Document contents may be reused by the **United States government** in developing the AI Action Plan and associated documents without attribution.*

Introduction

America stands at an unprecedented crossroads in the global AI competition—a moment when our choices will determine whether we lead or permanently cede technological leadership, economic prosperity, and geopolitical influence to China. Today's AI choices are also not merely about competing with China; they also represent a critical test of our nation's ability to protect American workers, revitalize our communities, safeguard existing industries, strengthen nation security, and establish democratic global leadership for decades.

China's aggressive, state-led AI strategy positions it to rapidly surpass the United States—not only in core AI technologies but across every sector AI influences. China's recent advancements, including open-source AI models, affordable open-source robotics, autonomous systems, custom AI hardware (non-GPU), and STEM talent pipelines, represent foundational elements of their expansive approach. Recognizing AI's potential to influence nearly 50% of global GDP, as recently forecasted by Chinese tech giant Alibaba,¹ China has aligned substantial state resources behind its AI strategy, announcing an unprecedented \$128 billion USD (¥1 trillion yuan) venture guidance fund alongside its established semiconductor-focused 'Big Fund.'² These state-backed investments, combined with an inclusive open-source strategy, aim to secure China's dominance across a vast range of

¹ <https://finance.yahoo.com/news/alibaba-going-trying-beat-us-071327635.html>

² <https://www.cnn.com/2025/03/06/tech/china-state-venture-capital-guidance-fund-intl-hnk/index.html>

industries, posing a multifaceted threat to American economic competitiveness, national security, and geopolitical influence.

Despite bipartisan acknowledgment of AI's existential stakes, recent official assessments have presented overly optimistic views that obscure America's true competitive standing. Outgoing National Security Advisor Jake Sullivan confidently declared the United States *"firmly in the lead"* on AI, calling it *"the single most dramatic development in human affairs in quite some time."*³ While optimism is understandable, history warns against misplaced confidence, recalling a similar assurance from Sullivan of "peace and stability in the Middle East." This occurred just prior to regional upheaval. Weeks after Sullivan's *'firmly in the lead'* remarks, lightning struck again and China's DeepSeek AI model dramatically demonstrated how quickly realities can shift.

In stark contrast, Vice President J.D. Vance, representing the incoming administration, recently underscored a more sobering reality: *"If we don't fundamentally change our approach, China's dominance in AI will become irreversible."*⁴ Vice President Vance's assessment underscores a critical bipartisan consensus—America urgently requires a transformative shift in its AI strategy, and this impacts critical industries.

To succeed, America's definition of victory must go beyond technological superiority or short-term corporate profitability. Winning the AI competition means strategically investing in an inclusive, expansive innovation ecosystem that:

- Creates high-quality, sustainable jobs across socioeconomic levels and communities nationwide.
- Prioritizes reshoring and revitalizing critical American industries, while protecting existing sectors from displacement by foreign AI-driven competitors.
- Secures alignment with neutral countries by establishing democratic technological standards globally, preventing these nations from dependence on China's AI ecosystem.
- Catalyzes broad-based community gains, reversing decades of manufacturing and economic decline and supports regional economic renewal.
- Ensures widespread and inclusive economic benefits, directly enhancing the livelihoods of all Americans rather than narrowly enriching a concentrated elite.

Today, America's AI ecosystem remains overly concentrated within a small number of well-funded incumbent firms, often closed-source and limiting broader economic

³ <https://nyp1.com/nyc/all-boroughs/news/2025/01/13/white-house-national-security-advisor-jake-sullivan-artificial-intelligence-ai-biden->

⁴ <https://www.youtube.com/watch?v=64E9O1Gv99o>

participation. One company directly and through its customers, Nvidia, has captured 90% plus of the market in AI hardware.⁵

History repeatedly demonstrates the danger of incumbent-focused policies, which have resulted in stagnation and permanent loss of competitiveness across critical industries—automotive manufacturing (GM bailouts), solar energy programs, telecommunications, and battery production, among others. By contrast, China has executed plans prioritizing agile, disruptive startups, rapidly creating entirely new industries. In automotive manufacturing, for instance, while U.S. policies preserved outdated incumbents, China invested in new companies like BYD, XPeng, and NIO, becoming the largest exporter in the world.⁶

However, AI uniquely introduces a new reality: unlike previous eras, economic competition is no longer primarily determined by labor availability or market-driven corporate profitability alone, but rather by the efficient and strategic allocation of capital into AI-driven technologies. Generative AI democratizes software development talent globally, rapidly eroding America’s traditional human-capital advantage. Simultaneously, AI reshapes entire sectors—manufacturing, robotics, autonomous systems—either complementing or substituting human labor at unprecedented scale. This profound shift means that the nations able to intentionally deploy capital into transformative AI technologies will decisively reshape markets, capture global economic sectors, and secure geopolitical dominance.

AI’s transformative potential presents America with two dramatically different pathways:

- **Automation-Driven Path (Negative Scenario):** Predominantly automates existing middle-to-high-income jobs, temporarily boosting corporate profits but causing significant unemployment, economic inequality, and further hollowing out America’s industrial base.
- **Innovation-Driven Path (Positive Scenario):** Prioritize reshoring critical industries, stimulates entirely new economic sectors, creates high-value, sustainable jobs nationwide, and actively protects existing industries from foreign technological displacement. This path fosters sustained economic dynamism, wide-spread wealth, and revitalization of American manufacturing and communities.

America's AI Action Plan must embrace this positive innovation-driven scenario, intentionally prioritizing disruptive startups, open-source ecosystems, inclusive STEM education, more affordable non-GPU infrastructure, plentiful energy, and robust domestic

⁵ <https://www.nasdaq.com/articles/nvidia-dominating-artificial-intelligence-chip-market-apple-has-been-securing-supply>

⁶ <https://rhg.com/research/from-fast-lane-to-gridlock-have-chinese-car-exports-peaked/>

manufacturing. The stakes are clear and existential—continued incumbent-centric policies risk permanently ceding economic and geopolitical influence to China.

America now faces an historic opportunity—and moral responsibility—to leverage AI innovation, safeguard American jobs, secure neutral nations within a democratic technological ecosystem, and deliver sustained, inclusive prosperity for all Americans. The moment for bold leadership, decisive investment, and inclusive economic renewal is now.

Context and Current Global Landscape

The global artificial intelligence landscape is evolving rapidly, reshaping economic, military, and geopolitical realities in ways comparable to historical transformations such as electrification, nuclear technology, or the internet. Today, the AI competition between the United States and China represents not merely technological rivalry, but a defining geopolitical struggle for the remainder of the 21st century.

To effectively respond, America must prioritize diversification in AI hardware infrastructure, reducing dependence on incumbent GPU-centric ecosystems. Emerging custom AI hardware innovations are now offering a viable, cost-effective path to democratize advanced AI capabilities nationwide. It's also part of our energy solution.

The Economic and Geopolitical Stakes of AI

The global economy will be fundamentally reshaped by AI. By 2030, AI is projected to add approximately \$15.7 trillion to global GDP, with China set to capture the largest share (approximately 26%) if current trends persist.⁷ This far exceeds the forecasted contribution of the United States (~14%), underscoring an unprecedented shift in global economic power toward China.

Beyond economics, AI's potential military and implications are enormous. From autonomous weapons systems and advanced intelligence capabilities to pervasive cyber operations, AI capabilities directly translate into military and geopolitical strength. Nations leading in AI will shape global standards, cybersecurity protocols, supply chains, and technological alliances—cementing their global influence.

⁷ <https://www.pwc.com/gx/en/issues/artificial-intelligence/publications/artificial-intelligence-study.html>

Lessons Learned from Historical Mistakes

Repeatedly, America has lost critical industries by relying excessively on incumbent corporations and entrenched interests rather than fostering disruptive innovation:

- **Automotive Industry (2008):** The U.S. auto bailout preserved incumbent corporations (GM, Chrysler), but sustained outdated models, losing global market share and competitiveness. Conversely, China invested aggressively in new automotive companies (BYD, XPeng, NIO), transforming itself into the world's largest exporter of electric vehicles.⁸
- **Solar Industry:** America's incumbent-oriented investments (e.g., Solyndra) led to stagnation and market collapse. China's startup-driven investments rapidly captured approximately 80% of the global solar manufacturing market, decisively overtaking U.S. producers.⁹
- **Battery Technology:** U.S. incumbents received funding that was insufficient and slow, resulting in America lagging significantly behind. China's strategic funding for battery innovators (CATL) now dominates global battery production, with approximately 70-90% global market share.¹⁰

These cases clearly illustrate the risks inherent in incumbent-focused investment strategies: incremental progress, stagnation of innovation, and ultimately, irreversible competitive decline.

China's AI Advantages: An Integrated Approach

China is replicating its past success across key AI technologies, moving quickly to consolidate leadership in several critical areas:

- **Open-Source AI Models:** China's open-source models (DeepSeek and Alibaba's Qwen) have rapidly proliferated globally due to their transparency, accessibility, and cost-effectiveness, directly challenging American companies with closed-source strategies like OpenAI's Chatgpt, xAI's Groq, and Anthropic's Claude.
- **General-Purpose Robotics and Manufacturing:** Chinese companies like Unitree Robotics are not only developing advanced, general-purpose robotic systems but rapidly commercializing and deploying them internationally. China's manufacturing sector already significantly outpaces U.S. manufacturing efficiency due to robotics,

⁸ <https://www.nytimes.com/interactive/2024/11/29/business/china-cars-sales-exports.html>

⁹ <https://www.woodmac.com/press-releases/china-dominance-on-global-solar-supply-chain/>

¹⁰ <https://carnegieendowment.org/research/2024/10/winning-the-battery-race-how-the-united-states-can-leapfrog-china-to-dominate-next-generation-battery-technologies?lang=en>

automation, and full-scale deployments of autonomous systems.¹¹

- **Hardware Infrastructure:** China is actively investing not only in GPU hardware, but also non-GPU-based AI hardware alternatives (FPGA and ASIC/LPU architectures), directly circumventing expensive Nvidia GPU ecosystems.¹² These technologies offer substantial performance, cost, and efficiency advantages, enabling Chinese firms to rapidly scale AI innovation without dependency on Western components. This is an all in CCP program.
- **Talent Expansion:** China's state-driven expansion of university admissions targets STEM and AI education, significantly increasing its talent pool to meet national goals. Leading universities like Peking University and Shanghai Jiao Tong University have substantially expanded their AI and engineering programs, ensuring a sustained and superior AI talent pipeline compared to the U.S..¹³
- **Global Leadership in AI Standards:** Through proactive leadership in setting global standards—particularly via open-source platforms—China is positioning itself to influence global infrastructure and economic alliances. Adopters of China's standards could become locked into China-centric AI ecosystems, further solidifying China's long-term geopolitical influence.

A Sobering Reality

The historical context combined with China's comprehensive strategy underscores a sobering reality: America risks repeating past errors by continuing incumbent-focused policies exemplified by the CHIPS Act. The United States urgently needs a bold new approach prioritizing disruptive innovation, agile new entrants, diversified hardware infrastructure beyond GPU incumbents like Nvidia, proactive reshoring strategies through robotics, and significant expansion of STEM-focused talent pipelines.

Our recommendations in this submission directly respond to these lessons, offering a clear path to regain global AI leadership, secure critical industries, and achieve broad-based economic prosperity. America must urgently act upon these insights or face permanent economic and geopolitical decline.

America's Imperative: Innovation Over Incumbency

¹¹ <https://semanalysis.com/2025/03/11/america-is-missing-the-new-labor-economy-robotics-part-1/>

¹² <https://www.scmp.com/news/china/science/article/3301251/chinese-ai-team-wins-global-award-replacing-nvidia-gpu-industrial-chip>

¹³ <https://www.reuters.com/world/china/chinas-top-universities-expand-enrolment-beef-up-capabilities-ai-strategic-areas-2025-03-10/>

America's most transformative economic and technological achievements have historically arisen not from protecting incumbent corporations, but from deliberately empowering visionary startups and fostering broad-based innovation ecosystems accessible to diverse participants. Ensuring AI success demands this same inclusive approach, broadening opportunities for smaller companies and regional innovators currently outside the incumbent-centric circles dominating AI today. Consider the Apollo program, which propelled U.S. aerospace dominance; DARPA's foundational role in creating the internet; and, most recently, transformative companies such as Tesla (AI company), SpaceX, and Palantir (AI company). Each vividly illustrates how government backing of visionary startups—not incumbents—can reshape global industries and secure lasting technological leadership.

Tesla's success, for instance, was catalyzed through crucial early U.S. government assistance, notably a pivotal \$465 million loan from the Department of Energy's Advanced Technology Vehicle Manufacturing program.¹⁴ In addition, Tesla along with other EV companies customers received substantial earlier tax credits in states like California. Similarly, SpaceX—today's leader in commercial space exploration—rapidly scaled due to government funding, including a \$396 million NASA contract in 2006.¹⁵ Similarly, the AI company Palantir benefited substantially from early-stage government contracts, leveraging federal support to establish itself as a leading force in data analytics critical to U.S. national security.

However, recent U.S. strategies have significantly diverged from this historically successful model. Policies like the CHIPS Act predominantly channel vast funds toward entrenched incumbents—such as Intel, Nvidia, and TSMC—instead of nurturing new startups and disruptive technologies. History demonstrates that incumbent-focused strategies consistently yield incremental results at best, and stagnation or outright loss of leadership at worst, as evidenced by America's struggles in automotive manufacturing, telecom infrastructure, solar panels, and battery technologies.

China, in sharp contrast, has been directing substantial investments into agile, disruptive startups, aggressively capturing sectors and reshaping global markets. China's coordinated state-backed investments—including the new landmark \$128 billion USD (¥1 trillion yuan) innovation fund and the "Big Fund," its well-known semiconductor industry investment initiative—are designed to nurture innovative AI ecosystems. By prioritizing agile, innovative startups rather than incumbents, China is rapidly dominating critical AI and technology sectors, positioning itself to define global economic and technological standards for decades to come.

¹⁴ <https://ir.tesla.com/press-release/tesla-gets-loan-approval-us-department-energy>

¹⁵ <https://www.nationalgeographic.com/science/article/how-spacex-became-nasas-go-to-ride-orbit>

Remarkably, China's approach has even successfully attracted and leveraged American innovation. Tesla's \$1.6 billion investment in its Shanghai Gigafactory was actively supported and facilitated by Chinese governmental incentives, streamlined regulatory approvals, and dedicated infrastructure support.¹⁶ This allowed China to quickly build a world-class EV supply chain domestically, enhancing its global automotive dominance while simultaneously weakening America's competitive position. Such moves illustrate the urgency with which America must prioritize nurturing and retaining innovative ecosystems domestically, rather than allowing U.S.-born innovations to fuel foreign competitiveness.

America must decisively embrace an innovation-driven approach, investing in technologies aimed not merely at short-term corporate profitability but at long-term economic revitalization, reshoring industries, and job creation. Such a strategy will not only position America to win the geopolitical AI competition with China, but also dramatically improve the lives and livelihoods of American citizens, revitalizing communities across the nation. The alternative—continued reliance on incumbent-focused strategies—risks repeating historic mistakes that have hollowed out American manufacturing and permanently weakened our economic and technological leadership.

The stakes could not be higher: America's long-term economic security, technological leadership, and the prosperity of future generations depend on decisively choosing this path of bold innovation and economic renewal.

Recommendations: Investing in America's Innovation Ecosystem for Broad-Based Economic Renewal

Given the stark landscape outlined, America requires immediate, decisive action directed toward fostering robust innovation ecosystems. Rather than merely investing in incumbent corporations or selecting technologies that promise short-term profitability alone, the following recommendations focus national policy on creating sustained economic benefits for everyday Americans, reshoring industries, fostering community economic renewal, and broadly distributing AI's gains across American society.

1. Establish a \$100 Billion National Innovation Fund for Community and Regional Revitalization

¹⁶<https://electrek.co/2019/12/26/tesla-secures-billion-financing-gigafactory-china/#:~:text=Tesla%20confirms%20it%20secured%20%241.6%20billion%20in%20financing%20for%20Gigafactory%20Shanghai.-Fred%20Lambert%20%7C%20Dec&text=Tesla%20released%20a%20filing%20today,world's%20largest%20electric%20vehicle%20market.>

America must urgently launch a \$100 billion National Innovation Fund over five years, designed to nurture 1,000 disruptive startups and create 500,000 high-quality American jobs. Unlike incumbent-focused policies such as the CHIPS Act, this fund prioritizes startups and innovative ventures committed to reshoring critical industries, revitalizing local communities, and ensuring sustained economic growth nationwide. Through targeted seed investments, grants, and incentives focused on regional manufacturing resurgence and affordable automation, this approach will ensure AI-driven gains benefit all Americans—not just a select tech elite. Let's foster broad-based innovation and secure a strong investment return for America's future.

Documented examples:

- China's \$128 billion innovation VC fund.
- Successful U.S. precedents: Tesla's \$465 million DOE loan, SpaceX's \$396 million NASA contract, and Palantir's early federal support.

2. Democratize and Diversify AI Hardware Infrastructure

America must reduce dependence on costly and vulnerable GPU-centric solutions dominated by incumbents like Nvidia. Federal investments should support alternative architectures—including FPGA-based systems, ASICs, and other innovative non-GPU hardware—making advanced AI capabilities more affordable, accessible, and broadly available. This diversification lowers entry barriers for startups, small businesses, universities, and local innovators, significantly accelerating regional innovation and broadening economic participation.

To scale this initiative, America should establish a \$50 billion **National AI Infrastructure Accelerator** by 2028, funding not only hardware innovation, but 20 GW of distributed regional data centers powered by renewable and nuclear energy projects. Inspired by the transformative 1956 Interstate Highway Act, this Accelerator will create approximately 250,000 jobs, accelerate AI and robotics deployment, and ensure that affordable computing resources are accessible nationwide. This proactive strategy directly counters China's expansive hardware investments and helps secure America's long-term technological competitiveness.

Documented Example: China's investment in FPGA-based infrastructure (e.g., DeepSeek) to circumvent Nvidia GPU dependency.¹⁷

¹⁷ <https://www.scmp.com/news/china/science/article/3301251/chinese-ai-team-wins-global-award-replacing-nvidia-gpu-industrial-chip>

3. Launch a National Open-Source AI Initiative

The US must champion open-source AI through a national initiative, strategically democratizing technology access and empowering small businesses, local startups, and regional economic ecosystems nationwide. An explicit commitment to open-source AI platforms ensures transparency, affordability, and broad-based accessibility, directly fostering local innovation, economic growth, and inclusive technological leadership that benefits communities broadly rather than reinforcing corporate monopolies or exclusivity.

While large corporations currently dominate the American AI landscape, launching a robust national initiative for open-source AI platforms would substantially broaden participation, accelerate innovation, and democratize AI capabilities across smaller businesses, startups, academia, and regional manufacturers. This inclusivity directly aligns with the administration's objective to ensure AI-driven wealth benefits all Americans, rather than a select few.

Documented example: China's global open-source leadership (Qwen and DeepSeek).

4. Prioritize General-Purpose Robotics for Regional Manufacturing

Federal investments should target general-purpose robotics to enable flexible and affordable automation, reshoring diverse manufacturing industries. Clear federal initiatives must support not only large manufacturers but regional, mid-sized, and smaller manufacturers. By prioritizing general-purpose robotics, America can significantly enhance its industrial capabilities, create quality American jobs, and broadly revitalize regional communities hollowed out by past offshoring.

By prioritizing accessible, cost-effective general-purpose robotics, America can quickly scale advanced manufacturing capabilities, particularly benefiting regions historically disadvantaged by industrial decline. This move aligns with bipartisan goals of reshoring manufacturing and creating broadly accessible, quality employment opportunities across diverse American communities.

Documented example: China's success rapidly scaling robotics (Unitree Robotics).

5. Expand Inclusive STEM and AI Education Nationwide

Explicit federal funding should substantially expand STEM and AI education programs, ensuring equitable geographic distribution and target underserved and rural communities. Grants and incentives should prioritize expanded AI curriculum in public schools, community college vocational training, and university STEM programs. An inclusive talent

pipeline will empower a broad spectrum of Americans, ensuring that economic benefits from AI-driven innovation are broadly shared across all regions and communities, revitalizing areas historically left behind.

To ensure broad-based economic benefits, federal initiatives must not only increase the number of STEM graduates but diversify the geographic and socioeconomic representation within AI education, particularly targeting historically underrepresented regions and populations. This broadening of access aligns directly with the administration's goal of inclusive economic renewal and technological leadership.

Documented example: China's expansion of STEM/AI university enrollment (Peking University, Shanghai Jiao Tong University).

6. Adopt AI-Focused Federal Procurement Supporting Small Innovators

Federal procurement policies should prioritize acquiring AI solutions and technologies from innovative startups and emerging firms—not merely established incumbents. Procurement guidelines and contracts should favor agile, innovative American companies whose business models align with reshoring manufacturing and domestic job creation. Similar targeted government procurement historically catalyzed industry-leading innovations, as demonstrated by Tesla, SpaceX, and Palantir, ultimately generating thousands of high-quality jobs and reshaping industries globally.

Documented examples:

- Tesla's \$465 million DOE loan
- SpaceX's early NASA contracts
- Palantir's federal partnerships.

7. Align AI Strategy with Community and Worker Interests

America's national AI strategy must prioritize technologies, deployments, and investments that directly benefit American workers and communities, rather than narrowly serving corporate profitability. Clear federal incentives, grants, and policies should support AI technologies designed to reshore jobs, revitalize communities, and build economic resilience locally. Explicitly avoiding indiscriminate automation, America's AI Action Plan should prioritize innovation that directly enhances workers' livelihoods, reversing the damaging hollowing-out effects historically caused by offshoring manufacturing.

Documented example: Negative historical examples of manufacturing offshoring consequences on American communities clearly documented.

8. Establish a Voluntary National AI Security Alliance

To safeguard America's AI leadership against national security risks posed by adversaries like China (e.g., DeepSeek's potential misuse), America must proactively assess frontier AI models without stifling innovation. We recommend establishing a Voluntary National AI Security Alliance, led by NIST and the Department of Defense, partnering with startups and labs to evaluate models for risks such as cybersecurity breaches or biological weapon development. This lightweight, optional framework—modeled on successful public-private collaborations like the Apollo program—provides classified threat intelligence to participants and ensures safety without burdensome mandates. By equipping innovators with tools to mitigate risks (e.g., cyber threats identified in Claude 3.7 Sonnet tests), this alliance strengthens U.S. defenses while fostering trust in AI deployment, ensuring America's technological edge remains secure and competitive globally.

Documented example: Anthropic's voluntary security exercises with U.S./U.K. AI Safety Institutes.

9. Lead a Democratic AI Standards Coalition

America should lead global AI governance by launching a Democratic AI Standards Coalition aligned with G7 and NATO countries. With an initial \$10 million seed fund, this coalition would set open-source norms—ensuring transparency and accessibility for smaller businesses—while promoting democratic values and economic fairness. Coordinating export controls and safety benchmarks with international allies will prevent China from locking nations into its authoritarian AI ecosystems, solidifying U.S. leadership in global standards-setting bodies (e.g., ISO). Such leadership helps American startups thrive globally, reinforcing America's technological advantage.

Documented Example: Google's NIST-led standards aligning with ISO 42001.

Conclusion: America's Moment of Strategic Clarity and Economic Renewal

America stands at a historic crossroads—facing decisions about artificial intelligence that will shape our economy, national security, and global influence for generations. The stakes are clear: without decisive leadership, the U.S. risks permanently ceding AI dominance to China, repeating past strategic failures in automotive, solar, battery, and telecommunications industries, where incumbent-focused investments led to stagnation and irreversible loss.

However, America has proven before—with visionary government backing—that bold, targeted support for disruptive innovators can secure global industry leadership and drive widespread prosperity.

The incoming administration faces a historic responsibility and an extraordinary opportunity: it must urgently embrace innovation-driven strategies that democratize AI, empower agile startups, revitalize regional economies, and deliver inclusive economic gains to all Americans—not just entrenched incumbents or concentrated elites. Only by explicitly prioritizing innovation, inclusive participation, robust job creation, expanded STEM education, and regional economic renewal can America reestablish global AI leadership, win critical neutral countries to democratic technological standards, and secure sustained, inclusive prosperity for generations.

The choice is clear and urgent. Let this moment define a new era of American innovation, economic revitalization, and democratic leadership. The time for bold vision and decisive action is now.

Warmest Regards,

Brian Costello,

Chief Executive Officer | ShiftIQ.ai | 

About ShiftIQ.AI

ShiftIQ.ai is an innovative start-up pioneering the emerging field of custom AI hardware. Our mission is to democratize the power of artificial intelligence, making advanced AI technologies accessible and affordable globally, with a strong emphasis on supporting American innovation and inclusive participation. By developing specialized, custom-designed, energy efficient hardware optimized for AI workloads, we're not only broadening and enhancing global AI infrastructure but also revitalizing domestic manufacturing and empowering American communities. Our goal is straightforward yet transformative: to ensure AI acts as a catalyst for inclusive growth and economic renewal, both in the U.S. and around the world.
